Package 'ORFik'

March 30, 2021

Type Package

Title Open Reading Frames in Genomics

Version 1.10.13

Encoding UTF-8

Description
R package for analysis of transcript and translation features through manipulation of sequence data and NGS data like Ribo-Seq, RNA-Seq, TCP-Seq and CAGE. It is generalized in the sense that any transcript region can be analysed, as the name hints to it was made with investigation of ribosomal patterns over Open Reading Frames (ORFs) as it's primary use case. ORFik is extremely fast through use of C++, data.table and GenomicRanges. Package allows to reassign starts of the transcripts with the use of CAGE-Seq data, automatic shifting of RiboSeq reads, finding of Open Reading Frames for whole genomes and much more.

git_branch RELEASE_3_12

git_last_commit 3f2976e

git_last_commit_date 2021-03-26

Date/Publication 2021-03-29

Author Haakon Tjeldnes [aut, cre, dtc],
Kornel Labun [aut, cph],
Katarzyna Chyzynska [ctb, dtc],
Yamila Torres Cleuren [ctb, ths],
Evind Valen [ths, fnd]

Maintainer Haakon Tjeldnes <hauken_heyken@hotmail.com>

R topics documented:

`ORFik-package` *ORFik for analysis of open reading frames.*

Description

Main goals:

1. Finding Open Reading Frames (very fast) in the genome of interest or on the set of transcripts/sequences.
2. Utilities for metaplots of RiboSeq coverage over gene START and STOP codons allowing to spot the shift.
3. Shifting functions for the RiboSeq data.
4. Finding new Transcription Start Sites with the use of CageSeq data.

5. Various measurements of gene identity e.g. FLOSS, coverage, ORFscore, entropy that are recreated based on many scientific publications.
6. Utility functions to extend GenomicRanges for faster grouping, splitting, tiling etc.

---

addCdsOnLeaderEnds *Extends leaders downstream*

Description

When finding uORFs, often you want to allow them to end inside the cds.

Usage

```
addCdsOnLeaderEnds(fiveUTRs, cds, onlyFirstExon = FALSE)
```

Arguments

fiveUTRs	The 5' leader sequences as GRangesList
cds	If you want to extend 5' leaders downstream, to catch uorfs going into cds, include it.
onlyFirstExon	logical (F), include whole cds or only first exons.

Details

This is a simple way to do that

Value

a GRangesList of cds exons added to ends

See Also

Other uorfs: filterUORFs(), removeORFsWithSameStartAsCDS(), removeORFsWithSameStopAsCDS(), removeORFsWithStartInsideCDS(), removeORFsWithinCDS(), uORFSearchSpace()

`addNewTSSOnLeaders` *Add cage max peaks as new transcript start sites for each 5' leader (*) strands are not supported, since direction must be known.*

Description

Add cage max peaks as new transcript start sites for each 5' leader (*) strands are not supported, since direction must be known.

Usage

```
addNewTSSOnLeaders(fiveUTRs, maxPeakPosition, removeUnused, cageMcol)
```

Arguments

`fiveUTRs`	(GRangesList) The 5' leaders or full transcript sequences
`maxPeakPosition`	The max peak for each 5' leader found by cage
`removeUnused`	logical (FALSE), if False: (standard is to set them to original annotation), If TRUE: remove leaders that did not have any cage support.
`cageMcol`	a logical (FALSE), if TRUE, add a meta column to the returned object with the raw CAGE counts in support for new TSS.

Value

a GRanges object of first exons

`allFeaturesHelper` *Calculate the features in computeFeatures function*

Description

Not used directly, calculates all features internally for computeFeatures.

Usage

```
allFeaturesHelper(
  grl,
  RFP,
  RNA,
  tx,
  fiveUTRs,
  cds,
  threeUTRs,
  faFile,
  riboStart,
  riboStop,
  sequenceFeatures,
  uorfFeatures,
```

```
  grl.is.sorted,
  weight.RFP = 1L,
  weight.RNA = 1L,
  st = NULL
)
```

Arguments

grl	a GRangesList object with usually ORFs, but can also be either leaders, cds', 3' utrs, etc. This is the regions you want to score.
RFP	RiboSeq reads as GAlignments , GRanges or GRangesList object
RNA	RnaSeq reads as GAlignments , GRanges or GRangesList object
tx	a GrangesList of transcripts, normally called from: exonsBy(Gtf, by = "tx", use.names = T) only add this if you are not including Gtf file If you are using CAGE, you do not need to reassign these to the cage peaks, it will do it for you.
fiveUTRs	fiveUTRs as GRangesList, if you used cage-data to extend 5' utrs, remember to input CAGE assigned version and not original!
cds	a GRangesList of coding sequences
threeUTRs	a GrangesList of transcript 3' utrs, normally called from: threeUTRsByTranscript(Gtf, use.names = T)
faFile	a path to fasta indexed genome, an open FaFile, a BSgenome, or path to ORFik experiment with valid genome.
riboStart	usually 26, the start of the floss interval, see ?floss
riboStop	usually 34, the end of the floss interval
sequenceFeatures	a logical, default TRUE, include all sequence features, that is: Kozak, fractionLengths, distORFCDS, isInFrame, isOverlapping and rankInTx. uorfFeatures = FALSE will remove the 4 last.
uorfFeatures	a logical, default TRUE, include all uORF sequence features, that is: distORFCDS, isInFrame, isOverlapping and rankInTx
grl.is.sorted	logical (F), a speed up if you know argument grl is sorted, set this to TRUE.
weight.RFP	a vector (default: 1L). Can also be character name of column in RFP. As in translationalEff(weight = "score") for: GRanges("chr1", 1, "+", score = 5), would mean score column tells that this alignment region was found 5 times.
weight.RNA	Same as weightRFP but for RNA weights. (default: 1L)
st	(NULL), if defined must be: st = startRegion(grl, tx, T, -3, 9)

Value

a data.table with features

`artificial.orfs` *Create small artificial orfs from cds*

Description

Usefull to see if short ORFs prediction is dependent on length.
Split cds first in two, a start part and stop part. Then say how large the two parts can be and merge them together. It will sample a value in range give.
Parts will be forced to not overlap and can not extend outside original cds

Usage

```
artificial.orfs(
  cds,
  start5 = 1,
  end5 = 4,
  start3 = -4,
  end3 = 0,
  bin.if.few = TRUE
)
```

Arguments

`cds`	a GRangesList of orfs, must have width %% 3 == 0 and length >= 6
`start5`	integer, default: 1 (start of orf)
`end5`	integer, default: 4 (max 4 codons from start codon)
`start3`	integer, default -4 (max 4 codons from stop codon)
`end3`	integer, default: 0 (end of orf)
`bin.if.few`	logical, default TRUE, instead of per codon, do per 2, 3, 4 codons if you have few samples compared to lengths wanted, If you have 4 cds' and you want 7 different lengths, which is the standard, it will give you possible nt length: 6-12-18-24 instead of original 6-9-12-15-18-21-24. If you have more than 30x cds than lengths wanted this is skipped. (for default arguments this is: 7*30 = 210 cds)

Details

If artificial cds length is not divisible by 2, like 3 codons, the second codon will always be from the start region etc.
Also If there are many very short original cds, the distribution will be skewed towards more smaller artificial cds.

Value

GRangesList of new ORFs (sorted: + strand increasing start, - strand decreasing start)

assignAnnotations *Overlaps GRanges object with provided annotations.*

Description

It will return same list of GRanges, but with metdata columns: trainscript_id - id of transcripts that overlap with each ORF gene_id - id of gene that this transcript belongs to isoform - for coding protein alignment in relation to cds on coresponding transcript, for non-coding transcripts alignment in relation to the transcript.

Usage

```
assignAnnotations(ORFs, con)
```

Arguments

ORFs	- GRanges or GRangesList object of your ORFs.
con	- Path to gtf file with annotations.

Value

A GRanges object of your ORFs with metadata columns 'gene', 'transcript', isoform' and 'biotype'.

assignFirstExonsStartSite *Reassign the start positions of the first exons per group in grl*

Description

Per group in GRangesList, assign the most upstream site.

Usage

```
assignFirstExonsStartSite(
  grl,
  newStarts,
  is.circular = all(isCircular(grl) %in% TRUE)
)
```

Arguments

grl	a GRangesList object
newStarts	an integer vector of same length as grl, with new start values (absolute coordinates, not relative)
is.circular	logical, default FALSE if not any is: all(isCircular(grl) Where grl is the ranges checked. If TRUE, allow ranges to extend below position 1 on chromosome. Since circular genomes can have negative coordinates.

Details

make sure your grl is sorted, since start of "-" strand objects should be the max end in group, use ORFik:::sortPerGroup(grl) to get sorted grl.

Value

the same GRangesList with new start sites

See Also

Other GRanges: `assignLastExonsStopSite()`, `downstreamFromPerGroup()`, `downstreamOfPerGroup()`, `upstreamFromPerGroup()`, `upstreamOfPerGroup()`

---

assignLastExonsStopSite

Reassign the stop positions of the last exons per group

Description

Per group in GRangesList, assign the most upstream site.

Usage

```
assignLastExonsStopSite(
  grl,
  newStops,
  is.circular = all(isCircular(grl) %in% TRUE)
)
```

Arguments

`grl`	a `GRangesList` object
`newStops`	an integer vector of same length as grl, with new start values (absolute coordinates, not relative)
`is.circular`	logical, default FALSE if not any is: all(isCircular(grl) Where grl is the ranges checked. If TRUE, allow ranges to extend below position 1 on chromosome. Since circular genomes can have negative coordinates.

Details

make sure your grl is sorted, since stop of "-" strand objects should be the min start in group, use ORFik:::sortPerGroup(grl) to get sorted grl.

Value

the same GRangesList with new stop sites

See Also

Other GRanges: `assignFirstExonsStartSite()`, `downstreamFromPerGroup()`, `downstreamOfPerGroup()`, `upstreamFromPerGroup()`, `upstreamOfPerGroup()`

`assignTSSByCage` *Input a txdb and add a 5' leader for each transcript, that does not have one.*

Description

For all cds in txdb, that does not have a 5' leader: Start at 1 base upstream of cds and use CAGE, to assign leader start. All these leaders will be 1 exon based, if you really want exon splicings, you can use exon prediction tools, or run sequencing experiments.

Usage

```
assignTSSByCage(
  txdb,
  cage,
  extension = 1000,
  filterValue = 1,
  restrictUpstreamToTx = FALSE,
  removeUnused = FALSE,
  preCleanup = TRUE
)
```

Arguments

`txdb`	a TxDb file, a path to one of: (.gtf ,.gff, .gff2, .gff2, .db or .sqlite) or an ORFik experiment
`cage`	Either a filePath for the CageSeq file as .bed .bam or .wig, with possible compressions (".gzip", ".gz", ".bgz"), or already loaded CageSeq peak data as GRanges or GAlignment. NOTE: If it is a .bam file, it will add a score column by running: convertToOneBasedRanges(cage, method = "5prime", addScoreColumn = TRUE) The score column is then number of replicates of read, if score column is something else, like read length, set the score column to NULL first.
`extension`	The maximum number of basses upstream of the TSS to search for CageSeq peak.
`filterValue`	The minimum number of reads on cage position, for it to be counted as possible new tss. (represented in score column in CageSeq data) If you already filtered, set it to 0.
`restrictUpstreamToTx`	a logical (FALSE). If TRUE: restrict leaders to not extend closer than 5 bases from closest upstream leader, set this to TRUE.
`removeUnused`	logical (FALSE), if False: (standard is to set them to original annotation), If TRUE: remove leaders that did not have any cage support.
`preCleanup`	logical (TRUE), if TRUE, remove all reads in region (-5:-1, 1:5) of all original tss in leaders. This is to keep original TSS if it is only +/- 5 bases from the original.

Details

Given a TxDb object, reassign the start site per transcript using max peaks from CageSeq data. A max peak is defined as new TSS if it is within boundary of 5' leader range, specified by 'extension' in bp. A max peak must also be higher than minimum CageSeq peak cutoff specified in 'filterValue'. The new TSS will then be the positioned where the cage read (with highest read count in the interval).

Value

a TxDb obect of reassigned transcripts

See Also

Other CAGE: `reassignTSSbyCage()`, `reassignTxDbByCage()`

Examples

```
txdbFile <- system.file("extdata", "hg19_knownGene_sample.sqlite",
 package = "GenomicFeatures")
cagePath <- system.file("extdata", "cage-seq-heart.bed.bgz",
 package = "ORFik")

## Not run:
  assignTSSByCage(txdbFile, cagePath)
  Minimum 20 cage tags for new TSS
  assignTSSByCage(txdbFile, cagePath, filterValue = 20)

## End(Not run)
```

---

asTX *Map genomic to transcript coordinates by reference*

Description

Map range coordinates between features in the genome and transcriptome (reference) space.

Usage

```
asTX(
  grl,
  reference,
  ignore.strand = FALSE,
  x.is.sorted = TRUE,
  tx.is.sorted = TRUE
)
```

Arguments

`grl`	a `GRangesList` of ranges within the reference, grl must have column called names that gives grouping for result
`reference`	a GrangesList of ranges that include and are bigger or equal to grl ig. cds is grl and gene can be reference

ignore.strand	When ignore.strand is TRUE, strand is ignored in overlaps operations (i.e., all strands are considered "+") and the strand in the output is '*'. When ignore.strand is FALSE (default) strand in the output is taken from the transcripts argument. When transcripts is a GRangesList, all inner list elements of a common list element must have the same strand or an error is thrown. Mapped position is computed by counting from the transcription start site (TSS) and is not affected by the value of ignore.strand.
x.is.sorted	if x is a GRangesList object, are "-" strand groups pre-sorted in decreasing order within group, default: TRUE
tx.is.sorted	if transcripts is a GRangesList object, are "-" strand groups pre-sorted in decreasing order within group, default: TRUE

Details

Similar to GenomicFeatures' pmapToTranscripts, but in this version the grl ranges are compared to reference ranges with same name, not by index. And it has a security fix.

Value

a GRangesList in transcript coordinates

See Also

Other ExtendGenomicRanges: coveragePerTiling(), extendLeaders(), extendTrailers(), reduceKeepAttr(), tile1(), txSeqsFromFa(), windowPerGroup()

---

bamVarName *Get library variable names from ORFik* experiment

---

Description

What will each sample be called given the columns of the experiment?

Usage

```
bamVarName(
  df,
  skip.replicate = length(unique(df$rep)) == 1,
  skip.condition = length(unique(df$condition)) == 1,
  skip.stage = length(unique(df$stage)) == 1,
  skip.fraction = length(unique(df$fraction)) == 1,
  skip.experiment = !df@expInVarName,
  skip.libtype = FALSE
)
```

Arguments

df	an ORFik experiment
skip.replicate	a logical (FALSE), don't include replicate in variable name.
skip.condition	a logical (FALSE), don't include condition in variable name.

skip.stage	a logical (FALSE), don't include stage in variable name.
skip.fraction	a logical (FALSE), don't include fraction
skip.experiment	a logical (FALSE), don't include experiment
skip.libtype	a logical (FALSE), don't include libtype

Value

variable names of libraries (character vector)

See Also

Other ORFik_experiment: ORFik.template.experiment(), create.experiment(), experiment-class, filepath(), libraryTypes(), organism.df(), outputLibs(), read.experiment(), save.experiment(), validateExperiments()

Examples

```
df <- ORFik.template.experiment()
bamVarName(df)

## without libtype
bamVarName(df, skip.libtype = TRUE)
## Without experiment name
bamVarName(df, skip.experiment = TRUE)
```

---

bamVarNamePicker *Get variable name per filepath in experiment*

Description

Get variable name per filepath in experiment

Usage

```
bamVarNamePicker(
  df,
  skip.replicate = FALSE,
  skip.condition = FALSE,
  skip.stage = FALSE,
  skip.fraction = FALSE,
  skip.experiment = FALSE,
  skip.libtype = FALSE
)
```

Arguments

df	an ORFik experiment
skip.replicate	a logical (FALSE), don't include replicate in variable name.
skip.condition	a logical (FALSE), don't include condition in variable name.
skip.stage	a logical (FALSE), don't include stage in variable name.

skip.fraction	a logical (FALSE), don't include fraction
skip.experiment	a logical (FALSE), don't include experiment
skip.libtype	a logical (FALSE), don't include libtype

Value

variable name of library (character vector)

`bedToGR` *Converts bed style data.frame to Granges*

Description

For info on columns, see: https://www.ensembl.org/info/website/upload/bed.html

Usage

```
bedToGR(x, skip.name = TRUE)
```

Arguments

x	A `data.frame` from imported bed-file, to convert to GRanges
skip.name	default (TRUE), skip name column (column 4)

Value

a `GRanges` object from bed

See Also

Other utils: `convertToOneBasedRanges()`, `export.bed12()`, `export.wiggle()`, `fimport()`, `findFa()`, `fread.bed()`, `optimizeReads()`, `readBam()`, `readWig()`

`cellLineNames` *Get cell-line name variants*

Description

Used to standardize nomeclature for experiments.
Example: THP-1 is main naming, but a variant is THP1 THP1 will then be renamed to THP-1

Usage

```
cellLineNames()
```

Value

a data.table with 2 columns, the main name, and all name variants of the main name in second column as a list.

See Also

Other experiment_naming: `conditionNames()`, `libNames()`, `mainNames()`, `repNames()`, `stageNames()`, `tissueNames()`

`changePointAnalysis` *Get the offset for specific RiboSeq read width*

Description

Creates sliding windows of transcript normalized counts per position and check which window has most in upstream window vs downstream window. Pick the position with highest absolute value maximum of the window difference. Checks windows with split sites between positions -17 to -7, where 0 is TIS. Normally you expect the shift around -12.

Usage

```
changePointAnalysis(
  x,
  feature = "start",
  max.pos = 40L,
  interval = seq.int(14L, 24L)
)
```

Arguments

`x`	a vector with count per position to analyse, assumes the zero position (TIS) is in the middle + 1 (position 0). Default it is size 60, from -30 to 29 in p-shifting
`feature`	(character) either "start" or "stop"
`max.pos`	integer, default 40L, subset x to go from index 1 to max.pos, if tail is not relevant.
`interval`	integer vector , default seq.int(14L, 24L). Seperation points for upstream and downstream windows. That is (+/- 5 from -12) position.

Details

Transcript normalized means per CDS TIS region, count reads per position, divide that number per position by the total of that transcript, then sum up these numbers per position for all transcripts.

Value

a single numeric offset, -12 would mean p-site is 12 bases upstream

See Also

Other pshifting: `detectRibosomeShifts()`, `shiftFootprintsByExperiment()`, `shiftFootprints()`

checkRFP *Helper Function to check valid RFP input*

Description

Helper Function to check valid RFP input

Usage

```
checkRFP(class)
```

Arguments

class,	the given class of RFP object

Value

NULL, stop if invalid object

See Also

Other validity: checkRNA(), is.ORF(), is.gr_or_grl(), is.grl(), is.range(), validGRL(), validSeqlevels()

checkRNA *Helper Function to check valid RNA input*

Description

Helper Function to check valid RNA input

Usage

```
checkRNA(class)
```

Arguments

class,	the given class of RNA object

Value

NULL, stop if unvalid object

See Also

Other validity: checkRFP(), is.ORF(), is.gr_or_grl(), is.grl(), is.range(), validGRL(), validSeqlevels()

codonSumsPerGroup *Get read hits per codon*

Description

Helper for entropy function, normally not used directly Seperate each group into tuples (abstract codons) Gives sum for each tuple within each group

Usage

```
codonSumsPerGroup(grl, reads, weight = "score", is.sorted = FALSE)
```

Arguments

grl	GRangesList or GRanges of your ranges
reads	GRanges object of your reads.
weight	(default: 'score'), if defined a character name of valid meta column in subject. GRanges("chr1", 1, "+", score = 5), would mean score column tells that this alignment region was found 5 times. ORFik .bedo files, contains a score column like this. As do CAGEr CAGE files and many other package formats. You can also assign a score column manually.
is.sorted	logical (FALSE), is grl sorted. That is + strand groups in increasing ranges (1,2,3), and - strand groups in decreasing ranges (3,2,1)

Details

Example: counts c(1,0,0,1), with reg_len = 2, gives c(1,0) and c(0,1), these are summed and returned as data.table 10 bases, will give 3 codons, 1 base codons does not exist.

Value

a data.table with codon sums

collapse.by.scores *Merge reads by sum of existing scores*

Description

If you have multiple reads a same location but different read lengths, specified in meta column "size", it will sum up the scores (number of replicates) for all reads at that position

Usage

```
collapse.by.scores(x)
```

Arguments

x	a GRanges object

Value

merged GRanges object

Examples

```
gr_s1 <- rep(GRanges("chr1", 1:10,"+"), 2)
gr_s2 <- GRanges("chr1", 1:12,"+")
gr2 <- GRanges("chr1", 21:40,"+")
gr <- c(gr_s1, gr_s2, gr2)
res <- convertToOneBasedRanges(gr,
   addScoreColumn = TRUE, addSizeColumn = TRUE)
ORFik:::collapse.by.scores(res)
```

---

collapse.fastq *Very fast fastq/fasta collapser*

Description

For each unique read in the file, collapse into 1 and state in the fasta header how many reads existed of that type. This is done after trimming usually, works best for reads < 50 read length. Not so effective for 150 bp length mRNA-seq etc.

Usage

```
collapse.fastq(
  files,
  outdir = file.path(dirname(files[1]), "collapsed"),
  header.out.format = "ribotoolkit",
  compress = FALSE
)
```

Arguments

files	paths to fasta / fastq files to collapse.
outdir	outdir to save files, default: file.path(dirname(files[1]),"collapsed"). Inside same folder as input files, then create subfolder "collapsed", and add a prefix of "collapsed_" to the output names in that folder.
header.out.format	character, default "ribotoolkit", else must be "fastx". How the read header of the output fasta should be formated: ribotoolkit: "<seq1_x55", sequence 1 has 55 duplicated reads collapsed. fastx: "<1-55", sequence 1 has 55 duplicated reads collapsed
compress	logical, default FALSE

Value

invisible(NULL)

Examples

```
fastq.folder <- tempdir() # <- Your fastq files
infiles <- dir(fastq.folder, "*.fastq", full.names = TRUE)
# collapse.fastq(infiles)
```

---

collapseDuplicatedReads

Collapse duplicated reads

Description

For every GRanges, GAlignments read, with the same: seqname, start, (cigar) / width and strand, collapse and give a new meta column called "score", which contains the number of duplicates of that read. If score column already exists, will return input object!

Usage

```
collapseDuplicatedReads(x, ...)
```

Arguments

x	a GRanges, GAlignments or GAlignmentPairs object
...	alternative arguments. addScoreColumn = TRUE, if FALSE, only collapse and not add score column.

Value

a GRanges, GAlignments or GAlignmentPairs object, same as input

Examples

```
gr <- rep(GRanges("chr1", 1:10,"+"), 2)
collapseDuplicatedReads(gr)
```

---

collapseDuplicatedReads,GAlignmentPairs-method

Collapse duplicated reads

Description

For every GRanges, GAlignments read, with the same: seqname, start, (cigar) / width and strand, collapse and give a new meta column called "score", which contains the number of duplicates of that read. If score column already exists, will return input object!

Usage

```
## S4 method for signature 'GAlignmentPairs'
collapseDuplicatedReads(x, addScoreColumn = TRUE)
```

Arguments

x	a GRanges, GAlignments or GAlignmentPairs object
addScoreColumn	= TRUE, if FALSE, only collapse and not add score column.

Value

a GRanges, GAlignments or GAlignmentPairs object, same as input

Examples

```
gr <- rep(GRanges("chr1", 1:10,"+"), 2)
collapseDuplicatedReads(gr)
```

---

collapseDuplicatedReads,GAlignments-method

Collapse duplicated reads

Description

For every GRanges, GAlignments read, with the same: seqname, start, (cigar) / width and strand, collapse and give a new meta column called "score", which contains the number of duplicates of that read. If score column already exists, will return input object!

Usage

```
## S4 method for signature 'GAlignments'
collapseDuplicatedReads(x, addScoreColumn = TRUE)
```

Arguments

x	a GRanges, GAlignments or GAlignmentPairs object
addScoreColumn	= TRUE, if FALSE, only collapse and not add score column.

Value

a GRanges, GAlignments or GAlignmentPairs object, same as input

Examples

```
gr <- rep(GRanges("chr1", 1:10,"+"), 2)
collapseDuplicatedReads(gr)
```

`collapseDuplicatedReads,GRanges-method`
Collapse duplicated reads

Description

For every GRanges, GAlignments read, with the same: seqname, start, (cigar) / width and strand, collapse and give a new meta column called "score", which contains the number of duplicates of that read. If score column already exists, will return input object!

Usage

```
## S4 method for signature 'GRanges'
collapseDuplicatedReads(
  x,
  addScoreColumn = TRUE,
  addSizeColumn = FALSE,
  reuse.score.column = TRUE
)
```

Arguments

`x`	a GRanges, GAlignments or GAlignmentPairs object
`addScoreColumn`	= TRUE, if FALSE, only collapse and not keep score column.
`addSizeColumn`	logical (FALSE), if TRUE, add a size column that for each read, that gives original width of read. Useful if you need original read lengths. This takes care of soft clips etc. If collapsing reads, each unique range will be grouped also by size.
`reuse.score.column`	logical (TRUE), if addScoreColumn is TRUE, and a score column exists, will sum up the scores to create a new score. If FALSE, will skip old score column and create new according to number of replicated reads after conversion. If addScoreColumn is FALSE, this argument is ignored.

Value

a GRanges, GAlignments or GAlignmentPairs object, same as input

Examples

```
gr <- rep(GRanges("chr1", 1:10,"+"), 2)
collapseDuplicatedReads(gr)
```

combn.pairs *Create all unique combinations pairs possible*

Description

Given a character vector, get all unique combinations of 2.

Usage

```
combn.pairs(x)
```

Arguments

x	a character vector, will unique elements for you.

Value

a list of character vector pairs

computeFeatures *Get all possible features in ORFik*

Description

If you want to get all the NGS and/or sequence features easily, you can use this function. Each feature have a link to an article describing its creation and idea behind it. Look at the functions in the feature family to see all of them. Example, if you want to know what the "te" column is, check out: ?translationalEff.

If you used CageSeq to reannotate your leaders, your txDB object must contain the reassigned leaders. Use [reassignTxDbByCage()] to get the txdb.

Usage

```
computeFeatures(
  grl,
  RFP,
  RNA = NULL,
  Gtf,
  faFile = NULL,
  riboStart = 26,
  riboStop = 34,
  sequenceFeatures = TRUE,
  uorfFeatures = TRUE,
  grl.is.sorted = FALSE,
  weight.RFP = 1L,
  weight.RNA = 1L
)
```

Arguments

grl	a GRangesList object with usually ORFs, but can also be either leaders, cds', 3' utrs, etc. This is the regions you want to score.
RFP	RiboSeq reads as GAlignments , GRanges or GRangesList object
RNA	RnaSeq reads as GAlignments , GRanges or GRangesList object
Gtf	a TxDb object of a gtf file or path to gtf, gff .sqlite etc.
faFile	a path to fasta indexed genome, an open FaFile, a BSgenome, or path to ORFik experiment with valid genome.
riboStart	usually 26, the start of the floss interval, see ?floss
riboStop	usually 34, the end of the floss interval
sequenceFeatures	a logical, default TRUE, include all sequence features, that is: Kozak, fractionLengths, distORFCDS, isInFrame, isOverlapping and rankInTx. uorfFeatures = FALSE will remove the 4 last.
uorfFeatures	a logical, default TRUE, include all uORF sequence features, that is: distORFCDS, isInFrame, isOverlapping and rankInTx
grl.is.sorted	logical (F), a speed up if you know argument grl is sorted, set this to TRUE.
weight.RFP	a vector (default: 1L). Can also be character name of column in RFP. As in translationalEff(weight = "score") for: GRanges("chr1", 1, "+", score = 5), would mean score column tells that this alignment region was found 5 times.
weight.RNA	Same as weightRFP but for RNA weights. (default: 1L)

Details

As a note the library is reduced to only reads overlapping 'tx', so the library size in fpkm calculation is done on this subset. This will help remove rRNA and other contaminants.
Also if you have only unique reads with a weight column, explaining the number of duplicated reads, set weights to make calculations correct. See getWeights

Value

a data.table with scores, each column is one score type, name of columns are the names of the scores, i.g [floss()] or [fpkm()]

See Also

Other features: computeFeaturesCage(), countOverlapsW(), disengagementScore(), distToCds(), distToTSS(), entropy(), floss(), fpkm_calc(), fpkm(), fractionLength(), initiationScore(), insideOutsideORF(), isInFrame(), isOverlapping(), kozakSequenceScore(), orfScore(), rankOrder(), ribosomeReleaseScore(), ribosomeStallingScore(), startRegionCoverage(), startRegion(), stopRegion(), subsetCoverage(), translationalEff()

Examples

```
# Here we make an example from scratch
# Usually the ORFs are found in orfik, which makes names for you etc.
gtf <- system.file("extdata", "annotations.gtf",
package = "ORFik") ## location of the gtf file
suppressWarnings(txdb <-
                  GenomicFeatures::makeTxDbFromGFF(gtf, format = "gtf"))
```

```
# use cds' as ORFs for this example
ORFs <- GenomicFeatures::cdsBy(txdb, by = "tx", use.names = TRUE)
ORFs <- makeORFNames(ORFs) # need ORF names
# make Ribo-seq data,
RFP <- unlistGrl(firstExonPerGroup(ORFs))
suppressWarnings(computeFeatures(ORFs, RFP, Gtf = txdb))
# For more details see vignettes.
```

`computeFeaturesCage` *Get all possible features in ORFik*

Description

If you have a txdb with correctly reassigned transcripts, use: [computeFeatures()]

Usage

```
computeFeaturesCage(
  grl,
  RFP,
  RNA = NULL,
  Gtf = NULL,
  tx = NULL,
  fiveUTRs = NULL,
  cds = NULL,
  threeUTRs = NULL,
  faFile = NULL,
  riboStart = 26,
  riboStop = 34,
  sequenceFeatures = TRUE,
  uorfFeatures = TRUE,
  grl.is.sorted = FALSE,
  weight.RFP = 1L,
  weight.RNA = 1L
)
```

Arguments

`grl`	a `GRangesList` object with usually ORFs, but can also be either leaders, cds', 3' utrs, etc. This is the regions you want to score.
`RFP`	RiboSeq reads as `GAlignments` , `GRanges` or `GRangesList` object
`RNA`	RnaSeq reads as `GAlignments` , `GRanges` or `GRangesList` object
`Gtf`	a TxDb object of a gtf file or path to gtf, gff .sqlite etc.
`tx`	a GrangesList of transcripts, normally called from: exonsBy(Gtf, by = "tx", use.names = T) only add this if you are not including Gtf file If you are using CAGE, you do not need to reassign these to the cage peaks, it will do it for you.
`fiveUTRs`	fiveUTRs as GRangesList, if you used cage-data to extend 5' utrs, remember to input CAGE assigned version and not original!
`cds`	a GRangesList of coding sequences

threeUTRs	a GrangesList of transcript 3' utrs, normally called from: threeUTRsByTranscript(Gtf, use.names = T)
faFile	a path to fasta indexed genome, an open FaFile, a BSgenome, or path to ORFik experiment with valid genome.
riboStart	usually 26, the start of the floss interval, see ?floss
riboStop	usually 34, the end of the floss interval
sequenceFeatures	a logical, default TRUE, include all sequence features, that is: Kozak, fractionLengths, distORFCDS, isInFrame, isOverlapping and rankInTx. uorfFeatures = FALSE will remove the 4 last.
uorfFeatures	a logical, default TRUE, include all uORF sequence features, that is: distORFCDS, isInFrame, isOverlapping and rankInTx
grl.is.sorted	logical (F), a speed up if you know argument grl is sorted, set this to TRUE.
weight.RFP	a vector (default: 1L). Can also be character name of column in RFP. As in translationalEff(weight = "score") for: GRanges("chr1", 1, "+", score = 5), would mean score column tells that this alignment region was found 5 times.
weight.RNA	Same as weightRFP but for RNA weights. (default: 1L)

Details

A specialized version if you don't have a correct txdb, for example with CAGE reassigned leaders while txdb is not updated. It is 2x faster for tested data. The point of this function is to give you the ability to input transcript etc directly into the function, and not load them from txdb. Each feature have a link to an article describing feature, try ?floss

Value

a data.table with scores, each column is one score type, name of columns are the names of the scores, i.g [floss()] or [fpkm()]

See Also

Other features: computeFeatures(), countOverlapsW(), disengagementScore(), distToCds(), distToTSS(), entropy(), floss(), fpkm_calc(), fpkm(), fractionLength(), initiationScore(), insideOutsideORF(), isInFrame(), isOverlapping(), kozakSequenceScore(), orfScore(), rankOrder(), ribosomeReleaseScore(), ribosomeStallingScore(), startRegionCoverage(), startRegion(), stopRegion(), subsetCoverage(), translationalEff()

Examples

```
# a small example without cage-seq data:
# we will find ORFs in the 5' utrs
# and then calculate features on them

if (requireNamespace("BSgenome.Hsapiens.UCSC.hg19")) {
 library(GenomicFeatures)
 # Get the gtf txdb file
 txdbFile <- system.file("extdata", "hg19_knownGene_sample.sqlite",
 package = "GenomicFeatures")
 txdb <- loadDb(txdbFile)

 # Extract sequences of fiveUTRs.
```

```
  fiveUTRs <- fiveUTRsByTranscript(txdb, use.names = TRUE)[1:10]
  faFile <- BSgenome.Hsapiens.UCSC.hg19::Hsapiens
  tx_seqs <- extractTranscriptSeqs(faFile, fiveUTRs)

  # Find all ORFs on those transcripts and get their genomic coordinates
  fiveUTR_ORFs <- findMapORFs(fiveUTRs, tx_seqs)
  unlistedORFs <- unlistGrl(fiveUTR_ORFs)
  # group GRanges by ORFs instead of Transcripts
  fiveUTR_ORFs <- groupGRangesBy(unlistedORFs, unlistedORFs$names)

  # make some toy ribo seq and rna seq data
  starts <- unlistGrl(ORFik:::firstExonPerGroup(fiveUTR_ORFs))
  RFP <- promoters(starts, upstream = 0, downstream = 1)
  score(RFP) <- rep(29, length(RFP)) # the original read widths

  # set RNA seq to duplicate transcripts
  RNA <- unlistGrl(exonsBy(txdb, by = "tx", use.names = TRUE))

  #ORFik:::computeFeaturesCage(grl = fiveUTR_ORFs, RFP = RFP,
  #  RNA = RNA, Gtf = txdb, faFile = faFile)

}
# See vignettes for more examples
```

`conditionNames` *Get condition name variants*

Description

Used to standardize nomeclature for experiments.
Example: WT is main naming, but a variant is control control will then be renamed to WT

Usage

```
conditionNames()
```

Value

a data.table with 2 columns, the main name, and all name variants of the main name in second column as a list.

See Also

Other experiment_naming: `cellLineNames()`, `libNames()`, `mainNames()`, `repNames()`, `stageNames()`, `tissueNames()`

config *Read directory config for ORFik experiments*

Description

Defines a folder for: 1. fastq files (raw_data)
2. bam files (processed data)
3. references (organism annotation and STAR index)

Usage

```
config(file = "~/Bio_data/ORFik_config.csv")
```

Arguments

file	file of config for ORFik, default: "~/Bio_data/ORFik_config.csv"

Details

Update or use another config using `config.save()` function.

Value

a named character vector of length 3

config.exper *Set directories for experiment*

Description

Defines a folder for: 1. fastq files (raw_data)
2. bam files (processed data)
3. references (organism annotation and STAR index)
4. Experiment (name of experiment)

Usage

```
config.exper(experiment, assembly, type, config = ORFik::config())
```

Arguments

experiment	short name of experiment (must be valid as a folder name)
assembly	name of organism and assembly (must be valid as a folder name)
type	name of sequencing type, Ribo-seq, RNA-seq, CAGE.. Can be more than one.
config	a named character vector of length 3, default: `ORFik::config()`

Value

named character vector of paths for experiment

Examples

```
## Save to default config location
#config.exper("Alexaki_Human", "Homo_sapiens_GRCh38_101", c("Ribo-seq", "RNA-seq"))
```

`config.save` *Save/update directory config for ORFik experiments*

Description

Defines a folder for fastq files (raw_data), bam files (processed data) and references (organism annotation and STAR index)

Usage

```
config.save(
  file = "~/Bio_data/ORFik_config.csv",
  fastq.dir,
  bam.dir,
  reference.dir
)
```

Arguments

`file`	file of config for ORFik, default: "~/Bio_data/ORFik_config.csv"
`fastq.dir`	directory where ORFik puts fastq file directories, default: config()["fastq"]
`bam.dir`	directory where ORFik puts bam file directories, default: config()["bam"]
`reference.dir`	directory where ORFik puts reference file directories, default: config()["ref"]

Value

invisible(NULL), file saved to disc

`convertLibs` *Converted format of NGS libraries*

Description

Export as either .ofst, .bedo or .bedoc files.
Export files as .bedo files: It is a bed file with 2 score columns. Gives a massive speedup when cigar string and bam flags are not needed.
Export files as .bedoc files: If cigar is needed, gives you replicates and cigar, so a fast way to load a GAlignment object, other bam flags are lost. If type is bedoc addSizeColumn and method will be ignored.

Usage

```
convertLibs(
  df,
  out.dir = dirname(df$filepath[1]),
  addScoreColumn = TRUE,
  addSizeColumn = TRUE,
  must.overlap = NULL,
  method = "None",
  type = "ofst",
  reassign.when.saving = FALSE,
  envir = .GlobalEnv
)
```

Arguments

df	an ORFik experiment
out.dir	optional output directory, default: dirname(df$filepath[1]), if it is NULL, it will just reassign R objects to simplified libraries.
addScoreColumn	logical, default TRUE, if FALSE will not add replicate numbers as score column, see ORFik::convertToOneBasedRanges.
addSizeColumn	logical, default TRUE, if FALSE will not add size (width) as size column, see ORFik::convertToOneBasedRanges. Does not apply for .ofst or .bedoc.
must.overlap	default (NULL), else a GRanges / GRangesList object, so only reads that overlap (must.overlap) are kept. This is useful when you only need the reads over transcript annotation or subset etc.
method	character, default "None", the method to reduce ranges, for more info see convertToOneBasedRanges
type	a character of format, default "ofst". Alternatives: "ofst", "wig","bedo" or "bedoc". Which format you want. Will make a folder within out.dir with this name containing the files.
reassign.when.saving	logical, default FALSE. If TRUE, will reassign library to converted form after saving. Ignored when out.dir = NULL.
envir	which environment to save to, default .GlobalEnv

Details

See export.bedo and export.bedoc for information on file formats

Value

NULL (saves files to disc or R .GlobalEnv)

Examples

```
df <- ORFik.template.experiment()
#convertLibs(df)
# Keep only 5' ends of reads
#convertLibs(df, method = "5prime")
```

convertToOneBasedRanges

Convert a GRanges Object to 1 width reads

Description

There are 5 ways of doing this
1. Take 5' ends, reduce away rest (5prime)
2. Take 3' ends, reduce away rest (3prime)
3. Tile to 1-mers and include all (tileAll)
4. Take middle point per GRanges (middle)
5. Get original with metacolumns (None)
You can also do multiple at a time, then output is GRangesList, where each list group is the operation (5prime is [1], 3prime is [2] etc)
Many other ways to do this have their own functions, like startSites and stopSites etc. To retain information on original width, set addSizeColumn to TRUE. To compress data, 1 GRanges object per unique read, set addScoreColumn to TRUE. This will give you a score column with how many duplicated reads there were in the specified region.

Usage

```
convertToOneBasedRanges(
  gr,
  method = "5prime",
  addScoreColumn = FALSE,
  addSizeColumn = FALSE,
  after.softclips = TRUE,
  along.reference = FALSE,
  reuse.score.column = TRUE
)
```

Arguments

gr	GRanges, GAlignment or GAlignmentPairs object to reduce.
method	the method to reduce ranges, see info. (5prime defualt)
addScoreColumn	logical (FALSE), if TRUE, add a score column that sums up the hits per unique range. This will make each read unique, so that each read is 1 time, and score column gives the number of collapsed hits. A useful compression. If addSizeColumn is FALSE, it will not differentiate between reads with same start and stop, but different length. If addSizeColumn is FALSE, it will remove it. Collapses after conversion.
addSizeColumn	logical (FALSE), if TRUE, add a size column that for each read, that gives original width of read. Useful if you need original read lengths. This takes care of soft clips etc. If collapsing reads, each unique range will be grouped also by size.
after.softclips	logical (TRUE), include softclips in width. Does not apply if along.reference is TRUE.

along.reference
: logical (FALSE), example: The cigar "26MI2" is by default width 28, but if along.reference is TRUE, it will be 26. The length of the read along the reference. Also "1D20M" will be 21 if by along.reference is TRUE. Intronic regions (cigar: N) will be removed. So: "1M200N19M" is 20, not 220.

reuse.score.column
: logical (TRUE), if addScoreColumn is TRUE, and a score column exists, will sum up the scores to create a new score. If FALSE, will skip old score column and create new according to number of replicated reads after conversion. If addScoreColumn is FALSE, this argument is ignored.

Details

NOTE: For special case of GAlignmentPairs, 5prime will only use left (first) 5' end and read and 3prime will use only right (last) 3' end of read in pair. tileAll and middle can possibly find poinst that are not in the reads since: lets say pair is 1-5 and 10-15, middle is 7, which is not in the read.

Value

Converted GRanges object

See Also

Other utils: `bedToGR()`, `export.bed12()`, `export.wiggle()`, `fimport()`, `findFa()`, `fread.bed()`, `optimizeReads()`, `readBam()`, `readWig()`

Examples

```
gr <- GRanges("chr1", 1:10,"+")
# 5 prime ends
convertToOneBasedRanges(gr)
# is equal to convertToOneBasedRanges(gr, method = "5prime")
# 3 prime ends
convertToOneBasedRanges(gr, method = "3prime")
# With lengths
convertToOneBasedRanges(gr, addSizeColumn = TRUE)
# With score (# of replicates)
gr <- rep(gr, 2)
convertToOneBasedRanges(gr, addSizeColumn = TRUE, addScoreColumn = TRUE)
```

---

correlation.plots *Correlation plots between all samples*

Description

Get 2 correlation plots of raw counts and log2(count + 1) over selected region in: c("mrna", "leaders", "cds", "trailers")

Usage

```
correlation.plots(
  df,
  output.dir,
  region = "mrna",
  type = "fpkm",
  height = 400,
  width = 400,
  size = 0.15
)
```

Arguments

df	an ORFik experiment
output.dir	directory to save to, 2 files named: cor_plot.png and cor_plot_log2.png
region	a character (default: mrna), make raw count matrices of whole mrnas or one of (leaders, cds, trailers)
type	which value to use, "fpkm", alternative "counts".
height	numeric, default 400 (in mm)
width	numeric, default 400 (in mm)
size	numeric, size of dots, default 0.15.

Value

invisible(NULL)

---

countOverlapsW *CountOverlaps with weights*

Description

Similar to countOverlaps, but takes an optional weight column. This is usually the score column

Usage

```
countOverlapsW(query, subject, weight = NULL, ...)
```

Arguments

query	IRanges, IRangesList, GRanges, GRangesList object. Usually transcript a transcript region.
subject	GRanges, GRangesList, GAlignment, usually reads.
weight	(default: NULL), if defined either numeric or character name of valid meta column in subject. If weight is single numeric, it is used for all. A normall weight is the score column given as weight = "score". GRanges("chr1", 1, "+", score = 5), would mean score column tells that this alignment region was found 5 times.
...	additional arguments passed to countOverlaps/findOverlaps

Value

a named vector of number of overlaps to subject weigthed by 'weight' column.

See Also

Other features: computeFeaturesCage(), computeFeatures(), disengagementScore(), distToCds(), distToTSS(), entropy(), floss(), fpkm_calc(), fpkm(), fractionLength(), initiationScore(), insideOutsideORF(), isInFrame(), isOverlapping(), kozakSequenceScore(), orfScore(), rankOrder(), ribosomeReleaseScore(), ribosomeStallingScore(), startRegionCoverage(), startRegion(), stopRegion(), subsetCoverage(), translationalEff()

Examples

```
gr1 <- GRanges(seqnames="chr1",
               ranges=IRanges(start = c(4, 9, 10, 30),
                              end = c(4, 15, 20, 31)),
               strand="+")
gr2 <- GRanges(seqnames="chr1",
               ranges=IRanges(start = c(1, 4, 15, 25),
                              end = c(2, 4, 20, 26)),
               strand=c("+"),
               score=c(10, 20, 15, 5))
countOverlaps(gr1, gr2)
countOverlapsW(gr1, gr2, weight = "score")
```

---

countTable *Extract count table directly from experiment*

Description

Used to quickly load read count tables to R.
If df is experiment: Extracts by getting /QC_STATS directory, and searching for region Requires ORFikQC to have been run on experiment!

Usage

```
countTable(df, region = "mrna", type = "count", collapse = FALSE)
```

Arguments

df	an ORFik experiment or path to folder with countTable, use path if not same folder as experiment libraries. Will subset to the count tables specified if df is experiment. If experiment has 4 rows and you subset it to only 2, then only those 2 count tables will be outputted.
region	a character vector (default: "mrna"), make raw count matrices of whole mrnas or one of (leaders, cds, trailers).
type	character, default: "count" (raw counts matrix). Which object type and normalization do you want ? "summarized" (SummarizedExperiment object), "deseq" (Deseq2 experiment, design will be all valid non-unique columns except replicates, change by using DESeq2::design, normalization alternatives are: "fpkm", "log2fpkm" or "log10fpkm".

collapse — a logical/character (default FALSE), if TRUE all samples within the group SAMPLE will be collapsed to one. If "all", all groups will be merged into 1 column called merged_all. Collapse is defined as rowSum(elements_per_group) / ncol(elements_per_group)

Details

If df is path to folder: Loads the the file in that directory with the regex region.rds, where region is what is defined by argument. If loaded as SummarizedExperiment or deseq, the colData will be made from ORFik.experiment information.

Value

a data.table/SummarizedExperiment/DESeq object of columns as counts / normalized counts per library, column name is name of library. Rownames must be unique for now. Might change.

See Also

Other countTable: `countTable_regions()`

Examples

```
# Make experiment
ORFik.template.experiment()
# Make QC report to get counts ++
# ORFikQC(df)

# Get count Table of mrnas
# countTable(df, "mrna")
# Get count Table of cds
# countTable(df, "cds")
# Get count Table of mrnas as fpkm values
# countTable(df, "mrna", type = "count")
# Get count Table of mrnas with collapsed replicates
# countTable(df, "mrna", collapse = TRUE)
# Get count Table of mrnas as summarizedExperiment
# countTable(df, "mrna", type = "summarized")
# Get count Table of mrnas as DESeq2 object,
# for differential expression analysis
# countTable(df, "mrna", type = "deseq")
```

---

countTable_regions *Make a list of count matrices from experiment*

Description

Make a list of count matrices from experiment

Usage

```
countTable_regions(
  df,
  out.dir = dirname(df$filepath[1]),
  longestPerGene = TRUE,
  geneOrTxNames = "tx",
  regions = c("mrna", "leaders", "cds", "trailers"),
  type = "count",
  lib.type = "ofst",
  weight = "score",
  BPPARAM = bpparam()
)
```

Arguments

df	an ORFik experiment
out.dir	optional output directory, default: dirname(df$filepath[1]). Will make a folder called "QC_STATS" with all results in this directory.
longestPerGene	a logical (default TRUE), if FALSE all transcript isoforms per gene.
geneOrTxNames	a character vector (default "tx"), should row names keep trancript names ("tx") or change to gene names ("gene")
regions	a character vector, default: c("mrna", "leaders", "cds", "trailers"), make raw count matrices of whole regions specified.
type	default: "count" (raw counts matrix), alternative is "fpkm", "log2fpkm" or "log10fpkm"
lib.type	a character(default: "default"), load files in experiment or some precomputed variant, either "ofst", "bedo", "bedoc" or "pshifted". These are made with ORFik:::convertLibs() or shiftFootprintsByExperiment(). Can also be custom user made folders inside the experiments bam folder.
weight	numeric or character, a column to score overlaps by. Default "score", will check for a metacolumn called "score" in libraries. If not found, will not use weights.
BPPARAM	how many cores/threads to use? default: bpparam()

Value

a list of data.table, 1 data.table per region. The regions will be the names the list elements.

See Also

Other countTable: countTable()

---

coverageByTranscriptW *coverageByTranscript with weights*

Description

Extends the function with weights, see coverageByTranscript for original function.

Usage

```
coverageByTranscriptW(x, transcripts, ignore.strand = FALSE, weight = 1L)
```

Arguments

x	reads (GRanges, GAlignments)
transcripts	GRangesList
ignore.strand	a logical (default: FALSE)
weight	a vector (default: 1L), if single number applies for all, else it must be the string name of a defined meta column in "x", that gives number of times a read was found. GRanges("chr1", 1, "+", score = 5), would mean score column tells that this alignment was found 5 times.

Value

Integer Rle of coverage, 1 per transcript

---

coverageGroupings *Get grouping for a coverage table in ORFik*

Description

Either of two groupings: GF: Gene, fraction FGF: Fraction, position, feature It finds which of these exists, and auto groups

Usage

```
coverageGroupings(logicals, grouping = "GF")
```

Arguments

logicals	size 2 logical vector, the is.null checks for each column,
grouping	which grouping to perform, default "GF" Gene & Fraction grouping. Alternative "FGF", Fraction & position & feature.

Details

Normally not used directly!

Value

a quote of the grouping to pass to data.table

`coverageHeatMap` *Create a heatmap of coverage*

Description

Creates a ggplot representing a heatmap of coverage:

- Rows : Position in region
- Columns : Read length
- Index intensity : (color) coverage scoring per index.

Coverage rows in heat map is fraction, usually fractions is divided into unique read lengths (standard Illumina is 76 unique widths, with some minimum cutoff like 15.) Coverage column in heat map is score, default zscore of counts. These are the relative positions you are plotting to. Like +/- relative to TIS or TSS.

Usage

```
coverageHeatMap(
  coverage,
  output = NULL,
  scoring = "zscore",
  legendPos = "right",
  addFracPlot = FALSE,
  xlab = "Position relative to start site",
  ylab = "Protected fragment length",
  colors = "default",
  title = NULL,
  increments.y = "auto",
  gradient.max = max(coverage$score)
)
```

Arguments

`coverage`	a data.table, e.g. output of scaledWindowCoverage
`output`	character string (NULL), if set, saves the plot as pdf or png to path given. If no format is given, is save as pdf.
`scoring`	character vector, default "zscore", Which scoring did you use to create? either of zscore, transcriptNormalized, sum, mean, median, .. see ?coverageScorings for info and more alternatives.
`legendPos`	a character, Default "right". Where should the fill legend be ? ("top", "bottom", "right", "left")
`addFracPlot`	Add margin histogram plot on top of heatmap with fractions per positions
`xlab`	the x-axis label, default "Position relative to start site"
`ylab`	the y-axis label, default "Protected fragment length"
`colors`	character vector, default: "default", this gives you: c("white", "yellow2", "yellow3", "lightblue", "blue", "navy"), do "high" for more high contrasts, or specify your own colors.

`title`	a character, default NULL (no title), what is the top title of plot?
`increments.y`	increments of y axis, default "auto". Or a numeric value < max position & > min position.
`gradient.max`	numeric, defualt: max(coverage$score). What data value should the top color be ? Good to use if you want to compare 2 samples, with the same color intensity, in that case set this value to the max score of the 2 coverage tables.

Details

Colors: Remember if you want to change anything like colors, just return the ggplot object, and reassign like: obj + scale_color_brewer() etc. Standard colors are:

- 0 reads in whole readlength :gray
- few reads in position :white
- medium reads in position :yellow
- many reads in position :dark blue

Value

a ggplot object of the coverage plot, NULL if output is set, then the plot will only be saved to location.

See Also

Other heatmaps: `heatMapL()`, `heatMapRegion()`, `heatMap_single()`

Other coveragePlot: `pSitePlot()`, `savePlot()`, `windowCoveragePlot()`

Examples

```
# An ORF
grl <- GRangesList(tx1 = GRanges("1", IRanges(1, 6), "+"))
# Ribo-seq reads
range <- IRanges(c(rep(1, 3), 2, 3, rep(4, 2), 5, 6), width = 1 )
reads <- GRanges("1", range, "+")
reads$size <- c(rep(28, 5), rep(29, 4)) # read size
coverage <- windowPerReadLength(grl, reads = reads, upstream = 0,
                                downstream = 5)

coverageHeatMap(coverage)

# With top sum bar
coverageHeatMap(coverage, addFracPlot = TRUE)
# See vignette for more examples
```

coveragePerTiling *Get coverage per group*

Description

It tiles each GRangesList group to width 1, and finds hits per position. A range from 1:5 will split into c(1,2,3,4,5) and count hits on each.

Usage

```
coveragePerTiling(
  grl,
  reads,
  is.sorted = FALSE,
  keep.names = TRUE,
  as.data.table = FALSE,
  withFrames = FALSE,
  weight = "score"
)
```

Arguments

grl	a GRangesList of 5' utrs, CDS, transcripts, etc.
reads	a GAlignments or GRanges object of RiboSeq, RnaSeq etc. Weigths for scoring is default the 'score' column in 'reads'
is.sorted	logical (FALSE), is grl sorted. That is + strand groups in increasing ranges (1,2,3), and - strand groups in decreasing ranges (3,2,1)
keep.names	logical (TRUE), keep names or not.
as.data.table	a logical (FALSE), return as data.table with 2 columns, position and count.
withFrames	a logical (FALSE), only available if as.data.table is TRUE, return the ORF frame, 1,2,3, where position 1 is 1, 2 is 2 and 4 is 1 etc.
weight	(default: 'score'), if defined a character name of valid meta column in subject. GRanges("chr1", 1, "+", score = 5), would mean score column tells that this alignment region was found 5 times. ORFik .bedo files, contains a score column like this. As do CAGEr CAGE files and many other package formats. You can also assign a score column manually.

Details

This is a safer speedup of coverageByTranscript from GenomicFeatures. It also gives the possibility to return as data.table, for faster computations. NOTE: If reads contains a $score column, it will presume that this is the number of replicates per reads, weights for the coverage() function. So delete the score column or set weight to something else if this is not wanted.

Value

a numeric RleList, one numeric-Rle per group with # of hits per position. Or data.table if as.data.table is TRUE, with column names c("count" [numeric or integer], "genes" [integer], "position" [integer])

See Also

Other ExtendGenomicRanges: asTX(), extendLeaders(), extendTrailers(), reduceKeepAttr(), tile1(), txSeqsFromFa(), windowPerGroup()

Examples

```
ORF <- GRanges(seqnames = "1",
               ranges = IRanges(start = c(1, 10, 20),
                                end = c(5, 15, 25)),
               strand = "+")
grl <- GRangesList(tx1_1 = ORF)
RFP <- GRanges("1", IRanges(25, 25), "+")
coveragePerTiling(grl, RFP, is.sorted = TRUE)
# now as data.table with frames
coveragePerTiling(grl, RFP, is.sorted = TRUE, as.data.table = TRUE,
                  withFrames = TRUE)
# With score column (usually replicated reads on that position)
RFP <- GRanges("1", IRanges(25, 25), "+", score = 5)
dt <- coveragePerTiling(grl, RFP, is.sorted = TRUE,
                        as.data.table = TRUE, withFrames = TRUE)
class(dt$count) # numeric
# With integer score column (faster and less space usage)
RFP <- GRanges("1", IRanges(25, 25), "+", score = 5L)
dt <- coveragePerTiling(grl, RFP, is.sorted = TRUE,
                        as.data.table = TRUE, withFrames = TRUE)
class(dt$count) # integer
```

---

coverageScorings *Add a coverage scoring scheme*

Description

Different scorings and groupings of a coverage representation.

Usage

```
coverageScorings(coverage, scoring = "zscore", copy.dt = TRUE)
```

Arguments

coverage	a data.table containing at least columns (count, position), it is possible to have additionals: (genes, fraction, feature)
scoring	a character, one of (zscore, transcriptNormalized, mean, median, sum, log2sum, log10sum, sumLength, meanPos and frameSum, periodic, NULL). More info in details
copy.dt	logical TRUE, copy object, to avoid overwriting original object. Set to false to speed up, if original object is not needed.

Details

Usually output of metaWindow or scaledWindowPositions is input in this function.

Content of coverage data.table: It must contain the count and position columns.

genes column: If you have multiple windows, the genes column must define which gene/transcript grouping the different counts belong to. If there is only a meta window or only 1 gene/transcript, then this column is not needed.

fraction column: If you have coverage of i.e RNA-seq and Ribo-seq, or TCP -seq of large and small subunite, divide into fractions. Like factor(RNA, RFP)

feature column: If gene group is subdivided into parts, like gene is transcripts, and feature column can be c(leader, cds, trailer) etc.

Given a data.table coverage of counts, add a scoring scheme. per: the grouping given, if genes is defined, group by per gene in default scoring.
Scorings:

- zscore (count-windowMean)/windowSD per)
- transcriptNormalized (sum(count / sum of counts per))
- mean (mean(count per))
- median (median(count per))
- sum (count per)
- log2sum (count per)
- log10sum (count per)
- sumLength (count per) / number of windows
- meanPos (mean per position per gene) used in scaledWindowPositions
- sumPos (sum per position per gene) used in scaledWindowPositions
- frameSum (sum per frame per gene) used in ORFScore
- frameSumPerL (sum per frame per read length)
- frameSumPerLG (sum per frame per read length per gene)
- fracPos (fraction of counts per position per gene)
- periodic (Fourier transform periodicity of meta coverage per fraction)
- NULL (no grouping, return input directly)

Value

a data.table with new scores (size dependent on score used)

See Also

Other coverage: `metaWindow()`, `regionPerReadLength()`, `scaledWindowPositions()`, `windowPerReadLength()`

Examples

```
dt <- data.table::data.table(count = c(4, 1, 1, 4, 2, 3),
                             position = c(1, 2, 3, 4, 5, 6))
coverageScorings(dt, scoring = "zscore")

# with grouping gene
dt$genes <- c(rep("tx1", 3), rep("tx2", 3))
coverageScorings(dt, scoring = "zscore")
```

`create.experiment` *Create a ORFik* `experiment`

Description

Create information on runs / samples from an experiment as a single R object. By using files in a folder / folders. It will try to make an experiment table with information per sample. There will be several columns you can fill in, most of there it will try to auto-detect. Like if it is RNA-seq or Ribo-seq, Wild type or mutant etc. You will have to fill in the details that were not auto detected. Easiest way to fill in the blanks are in a csv editor like libre Office or excel. Remember that each row (sample) must have a unique combination of values. An extra column called "reverse" is made if there are paired data, like +/- strand wig files.

Usage

```
create.experiment(
  dir,
  exper,
  saveDir = "~/Bio_data/ORFik_experiments/",
  txdb = "",
  fa = "",
  organism = "",
  pairedEndBam = FALSE,
  viewTemplate = TRUE,
  types = c("bam", "bed", "wig"),
  libtype = "auto",
  stage = "auto",
  rep = "auto",
  condition = "auto",
  fraction = "auto"
)
```

Arguments

`dir`	Which directory / directories to create experiment from
`exper`	Short name of experiment, max 5 characters long
`saveDir`	Directory to save experiment csv file, default: "~/Bio_data/ORFik_experiments/" Set to NULL if you don't want to save it to disc.
`txdb`	A path to gff/gtf file used for libraries
`fa`	A path to fasta genome/sequences used for libraries, remember the file must have a fasta index too.
`organism`	character, default: "" (no organism set), scientific name of organism. Homo sapiens, Danio rerio, Rattus norvegicus etc. If you have a SRA metadata csv file, you can set this argument to study$ScientificName[1], where study is the SRA metadata for all files that was aligned.
`pairedEndBam`	logical FALSE, else TRUE, or a logical list of TRUE/FALSE per library you see will be included (run first without and check what order the files will come in) 1 paired end file, then two single will be c(T, F, F). If you have a SRA metadata csv file, you can set this argument to study$LibraryLayout == "PAIRED", where study is the SRA metadata for all files that was aligned.

viewTemplate	run View() on template when finished, default (TRUE)
types	Default (bam, bed, wig), which types of libraries to allow
libtype	character, default "auto". Library types, must be length 1 or equal length of number of libraries. "auto" means ORFik will try to guess from file name.
stage	character, default "auto". Developmental stage, tissue or cell line, must be length 1 or equal length of number of libraries. "auto" means ORFik will try to guess from file name.
rep	character, default "auto". Replicate numbering, must be length 1 or equal length of number of libraries. "auto" means ORFik will try to guess from file name.
condition	character, default "auto". Library conditions, must be length 1 or equal length of number of libraries. "auto" means ORFik will try to guess from file name.
fraction	character, default "auto". Fractionation of library, must be length 1 or equal length of number of libraries. "auto" means ORFik will try to guess from file name.

Value

a data.frame, NOTE: this is not a ORFik experiment, only a template for it!

See Also

Other ORFik_experiment: ORFik.template.experiment(), bamVarName(), experiment-class, filepath(), libraryTypes(), organism.df(), outputLibs(), read.experiment(), save.experiment(), validateExperiments()

Examples

```
# 1. Pick directory
dir <- system.file("extdata", "", package = "ORFik")
# 2. Pick an experiment name
exper <- "ORFik"
# 3. Pick .gff/.gtf location
txdb <- system.file("extdata", "annotations.gtf", package = "ORFik")
# 4. Pick fasta genome of organism
fa <- system.file("extdata", "genome.fasta", package = "ORFik")
# 5. Set organism (optional)
org <- "Homo sapiens"

# Create temple not saved on disc yet:
template <- create.experiment(dir = dir, exper, txdb = txdb,
                              saveDir = NULL,
                              fa = fa, organism = org,
                              viewTemplate = FALSE)
## Now fix non-unique rows: either is libre office, microsoft excel, or in R
template$X5[6] <- "heart"
# read experiment (if you set correctly)
df <- read.experiment(template)
# Save with: save.experiment(df, file = "path/to/save/experiment.csv")

## Create and save experiment directly:
## Default location: "~/Bio_data/ORFik_experiments/"
#template <- create.experiment(dir = dir, exper, txdb = txdb,
#                              fa = fa, organism = org,
#                              viewTemplate = FALSE)
```

```
## Custom location
#template <- create.experiment(dir = dir, exper, txdb = txdb,
#                               saveDir = "~/MY/CUSTOME/LOCATION",
#                               fa = fa, organism = org,
#                               viewTemplate = FALSE)
```

`defineIsoform` *Overlaps GRanges object with provided annotations.*

Description

Overlaps GRanges object with provided annotations.

Usage

```
defineIsoform(
  rel_orf,
  tran,
  isoform_names = c("perfect_match", "elong_START_match", "trunc_START_match",
    "elong_STOP_match", "trunc_STOP_match", "overlap_inside", "overlap_both",
    "overlap_upstream", "overlap_downstream", "upstream", "downstram", "none")
)
```

Arguments

`rel_orf`	- GRanges object of your ORF.
`tran`	- GRanges object of annotation (transcript or cds) that overlapped in some way rel_orf.
`isoform_names`	- A vector of strings that will be used instead of these defaults: 'perfect_match' - start and stop matches the tran object strand wise 'elong_START_match' - rel_orf is extension from the STOP side of the tran 'trunc_START_match' - rel_orf is truncation from the STOP side of the tran 'elong_STOP_match' - rel_orf is extension from the START side of the tran 'trunc_STOP_match' - rel_orf is truncation from the START side of the tran 'overlap_inside' - rel_orf is inside tran object 'overlap_both' - rel_orf contains tran object inside 'overlap_upstream' - rel_orf is overlaping upstream part of the tran 'overlap_downstream' - rel_orf is overlaping downstream part of the tran 'upstream' - rel_orf is upstream towards the tran 'downstream' - rel_orf is downstream towards the tran 'none' - when none of the above options is true

Value

A string object of defined isoform towards transcript.

`defineTrailer` *Defines trailers for ORF.*

Description

Creates GRanges object as a trailer for ORFranges representing ORF, maintaining restrictions of transcriptRanges. Assumes that ORFranges is on the transcriptRanges, strands and seqlevels are in agreement. When lengthOFtrailer is smaller than space left on the transcript than all available space is returned as trailer.

Usage

```
defineTrailer(ORFranges, transcriptRanges, lengthOftrailer = 200)
```

Arguments

`ORFranges`	GRanges object of your Open Reading Frame.
`transcriptRanges`	GRanges object of transtript.
`lengthOftrailer`	Numeric. Default is 10.

Details

It assumes that ORFranges and transcriptRanges are not sorted when on minus strand. Should be like: (200, 600) (50, 100)

Value

A GRanges object of trailer.

See Also

Other ORFHelpers: `longestORFs()`, `mapToGRanges()`, `orfID()`, `startCodons()`, `startSites()`, `stopCodons()`, `stopSites()`, `txNames()`, `uniqueGroups()`, `uniqueOrder()`

Examples

```
ORFranges <- GRanges(seqnames = Rle(rep("1", 3)),
                     ranges = IRanges(start = c(1, 10, 20),
                                      end = c(5, 15, 25)),
                     strand = "+")
transcriptRanges <- GRanges(seqnames = Rle(rep("1", 5)),
                            ranges = IRanges(start = c(1, 10, 20, 30, 40),
                                             end = c(5, 15, 25, 35, 45)),
                     strand = "+")
defineTrailer(ORFranges, transcriptRanges)
```

`detectRibosomeShifts` *Detect ribosome shifts*

Description

Utilizes periodicity measurement (Fourier transform), and change point analysis to detect ribosomal footprint shifts for each of the ribosomal read lengths. Returns subset of read lengths and their shifts for which top covered transcripts follow periodicity measure. Each shift value assumes 5' anchoring of the reads, so that output offsets values will shift 5' anchored footprints to be on the p-site of the ribosome. The E-site will be shift + 3 and A site will be shift - 3. So update to these, if you rather want those.

Usage

```
detectRibosomeShifts(
  footprints,
  txdb,
  start = TRUE,
  stop = FALSE,
  top_tx = 10L,
  minFiveUTR = 30L,
  minCDS = 150L,
  minThreeUTR = 30L,
  firstN = 150L,
  tx = NULL,
  min_reads = 1000,
  accepted.lengths = 26:34,
  heatmap = FALSE,
  must.be.periodic = TRUE
)
```

Arguments

`footprints`	GAlignments object of RiboSeq reads - footprints, can also be path to the .bam /.ofst file. If GAlignment object has a meta column called "score", this will be used as replicate numbering for that read. So be careful if you have custom files with score columns, with another meaning.
`txdb`	a TxDb file, a path to one of: (.gtf ,.gff, .gff2, .gff2, .db or .sqlite) or an ORFik experiment
`start`	(logical) Whether to include predictions based on the start codons. Default TRUE.
`stop`	(logical) Whether to include predictions based on the stop codons. Default FASLE. Only use if there exists 3' UTRs for the annotation. If peridicity around stop codon is stronger than at the start codon, use stop instead of start region for p-shifting.
`top_tx`	(integer), default 10. Specify which reads transcripts to use for estimation of the shifts. By default we take top 10 top covered transcripts as they represent less noisy dataset. This is only applicable when there are more than 1000 transcripts.
`minFiveUTR`	(integer) minimum bp for 5' UTR during filtering for the transcripts. Set to NULL if no 5' UTRs exists for annotation.

minCDS	(integer) minimum bp for CDS during filtering for the transcripts
minThreeUTR	(integer) minimum bp for 3' UTR during filtering for the transcripts. Set to NULL if no 3' UTRs exists for annotation.
firstN	(integer) Represents how many bases of the transcripts downstream of start codons to use for initial estimation of the periodicity.
tx	a GRangesList, if you do not have 5' UTRs in annotation, send your own version. Example: extendLeaders(tx, 30) Where 30 bases will be new "leaders". Since each original transcript was either only CDS or non-coding (filtered out).
min_reads	default (1000), how many reads must a read-length have to be considered for periodicity.
accepted.lengths	accepted readlengths, default 26:34, usually ribo-seq is strongest between 27:32.
heatmap	a logical or character string, default FALSE. If TRUE, will plot heatmap of raw reads before p-shifting to console, to see if shifts given make sense. You can also set a filepath to save the file there.
must.be.periodic	logical TRUE, if FALSE will not filter on periodic read lengths. (The Fourier transform filter will be skipped).

Details

Check out vignette for the examples of plotting RiboSeq metaplots over start and stop codons, so that you can verify visually whether this function detects correct shifts.

For how the Fourier transform works, see: isPeriodic
For how the changepoint analysis works, see: changePointAnalysis

NOTE: It will remove softclips from valid width, the CIGAR 3S30M is qwidth 33, but will remove 3S so final read width is 30 in ORFik. This is standard for ribo-seq.

Value

a data.table with lengths of footprints and their predicted coresponding offsets

References

https://bmcgenomics.biomedcentral.com/articles/10.1186/s12864-018-4912-6

See Also

Other pshifting: changePointAnalysis(), shiftFootprintsByExperiment(), shiftFootprints()

Examples

```
## Basic run
# Transcriptome annotation ->
gtf_file <- system.file("extdata", "annotations.gtf", package = "ORFik")
# Ribo seq data ->
riboSeq_file <- system.file("extdata", "ribo-seq.bam", package = "ORFik")
## Not run:
footprints <- readBam(riboSeq_file)

detectRibosomeShifts(footprints, gtf_file, stop = TRUE)
```

```
## Subset bam file
param = ScanBamParam(flag = scanBamFlag(
                       isDuplicate = FALSE,
                       isSecondaryAlignment = FALSE))
footprints <- readBam(riboSeq_file, param = param)
detectRibosomeShifts(footprints, gtf_file, stop = TRUE)

## Without 5' Annotation
library(GenomicFeatures)

txdb <- loadTxdb(gtf_file)
tx <- exonsBy(txdb, by = "tx", use.names = TRUE)
tx <- extendLeaders(tx, 30)
# Now run function, without 5' and 3' UTRs
detectRibosomeShifts(footprints, txdb, start = TRUE, minFiveUTR = NULL,
                     minCDS = 150L, minThreeUTR = NULL, firstN = 150L,
                     tx = tx)

## End(Not run)
```

`disengagementScore` *Disengagement score (DS)*

Description

Disengagement score is defined as

`(RPFs over ORF)/(RPFs downstream to transcript end)`

A pseudo-count of one is added to both the ORF and downstream sums.

Usage

```
disengagementScore(
  grl,
  RFP,
  GtfOrTx,
  RFP.sorted = FALSE,
  weight = 1L,
  overlapGrl = NULL
)
```

Arguments

`grl`	a `GRangesList` object with usually either leaders, cds', 3' utrs or ORFs.
`RFP`	RiboSeq reads as GAlignments, GRanges or GRangesList object
`GtfOrTx`	If it is `TxDb` object transcripts will be extracted using `exonsBy(Gtf,by = "tx",use.names = TRUE)`. Else it must be `GRangesList`
`RFP.sorted`	logical (FALSE), an optimizer, have you ran this line: `RFP <-sort(RFP[countOverlaps(RFP,tx,ty = "within") > 0])` Normally not touched, for internal optimization purposes.

weight	a vector (default: 1L, if 1L it is identical to countOverlaps()), if single number (!= 1), it applies for all, if more than one must be equal size of 'reads'. else it must be the string name of a defined meta column in subject "reads", that gives number of times a read was found. GRanges("chr1", 1, "+", score = 5), would mean "score" column tells that this alignment region was found 5 times.
overlapGrl	an integer, (default: NULL), if defined must be countOverlaps(grl, RFP), added for speed if you already have it

Value

a named vector of numeric values of scores

disengagementScore(grl, RFP, tx)
```

---

distToCds *Get distances between ORF ends and starts of their transcripts cds.*

Description

Will calculate distance between each ORF end and begining of the corresponding cds (main ORF). Matching is done by transcript names. This is applicable practically to the upstream (fiveUTRs) ORFs only. The cds start site, will be presumed to be on + 1 of end of fiveUTRs.

Usage

```
distToCds(ORFs, fiveUTRs, cds = NULL)
```

Arguments

ORFs	orfs as GRangesList, names of orfs must be transcript names
fiveUTRs	fiveUTRs as GRangesList, remember to use CAGE version of 5' if you did CAGE reassignment!
cds	cds' as GRangesList, only add if you have ORFs going into CDS.

Value

an integer vector, +1 means one base upstream of cds, -1 means 2nd base in cds, 0 means orf stops at cds start.

References

doi: 10.1074/jbc.R116.733899

Examples

```
grl <- GRangesList(tx1_1 = GRanges("1", IRanges(1, 10), "+"))
fiveUTRs <- GRangesList(tx1 = GRanges("1", IRanges(1, 20), "+"))
distToCds(grl, fiveUTRs)
```

---

distToTSS *Get distances between ORF Start and TSS of its transcript*

Description

Matching is done by transcript names. This is applicable practically to any region in Transcript If ORF is not within specified search space in tx, this function will crash.

Usage

```
distToTSS(ORFs, tx)
```

Arguments

ORFs	orfs as GRangesList, names of orfs must be txname_[rank]
tx	transcripts as GRangesList.

Value

an integer vector, 1 means on TSS, 2 means second base of Tx.

References

doi: 10.1074/jbc.R116.733899

```
grl <- GRangesList(tx1_1 = GRanges("1", IRanges(5, 10), "+"))
tx <- GRangesList(tx1 = GRanges("1", IRanges(2, 20), "+"))
distToTSS(grl, tx)
```

---

download.ebi *Faster download of fastq files*

Description

Uses ftp download from vol1 drive on EBI ftp server, for faster download of ERR, SRR or DRR files. But does not support subsetting or custom settings of files!

Usage

```
download.ebi(info, outdir, rename = TRUE, BPPARAM = bpparam())
```

Arguments

info	character vector of only SRR numbers or a data.frame with SRA metadata information including the SRR numbers in a column called "Run" or "SRR". Can be SRR, ERR or DRR numbers. If only SRR numbers can not rename, since no additional information is given.
outdir	a string, default: cbu server
rename	logical or character, default TRUE (Auto guess new names). False: Skip renaming. A character vector of equal size as files wanted can also be given. Priority of renaming from the metadata is to check for unique names in the LibraryName column, then the sample_title column if no valid names in LibraryName. If new names found and still duplicates, will add "_rep1", "_rep2" to make them unique. If no valid names, will not rename, that is keep the SRR numbers, you then can manually rename files to something more meaningful.
BPPARAM	how many cores/threads to use? default: bpparam(). To see number of threads used, do bpparam()$workers

Value

character, full filepath of downloaded files

See Also

Other sra: download.SRA.metadata(), download.SRA(), install.sratoolkit(), rename.SRA.files()

`download.SRA` *Download read libraries from SRA*

Description

Multicore version download, see documentation for SRA toolkit for more information.

Usage

```
download.SRA(
  info,
  outdir,
  rename = TRUE,
  fastq.dump.path = install.sratoolkit(),
  settings = paste("--skip-technical", "--split-files"),
  subset = NULL,
  compress = TRUE,
  BPPARAM = bpparam()
)
```

Arguments

`info`	character vector of only SRR numbers or a data.frame with SRA metadata information including the SRR numbers in a column called "Run" or "SRR". Can be SRR, ERR or DRR numbers. If only SRR numbers can not rename, since no additional information is given.
`outdir`	a string, default: cbu server
`rename`	logical or character, default TRUE (Auto guess new names). False: Skip renaming. A character vector of equal size as files wanted can also be given. Priority of renaming from the metadata is to check for unique names in the LibraryName column, then the sample_title column if no valid names in LibraryName. If new names found and still duplicates, will add "_rep1", "_rep2" to make them unique. If no valid names, will not rename, that is keep the SRR numbers, you then can manually rename files to something more meaningful.
`fastq.dump.path`	path to fastq-dump binary, default: path returned from install.sratoolkit()
`settings`	a string of arguments for fastq-dump, default: paste("–gzip", "–skip-technical", "–split-files")
`subset`	an integer or NULL, default NULL (no subset). If defined as a integer will download only the first n reads specified by subset. If subset is defined, will force to use fastq-dump which is slower than ebi download.
`compress`	logical, default TRUE. Download compressed files ".gz".
`BPPARAM`	how many cores/threads to use? default: bpparam(). To see number of threads used, do `bpparam()$workers`

Value

a character vector of download files filepaths

References

https://ncbi.github.io/sra-tools/fastq-dump.html

See Also

Other sra: download.SRA.metadata(), download.ebi(), install.sratoolkit(), rename.SRA.files()

Examples

```
SRR <- c("SRR453566") # Can be more than one

## Simple single SRR run of YEAST
outdir <- tempdir() # Specify output directory
# Download, get 5 first reads
#download.SRA(SRR, outdir, subset = 5)

## Using metadata column to get SRR numbers and to be able to rename samples
outdir <- tempdir() # Specify output directory
info <- download.SRA.metadata("SRP226389", outdir) # By study id
# Download, 5 first reads of each library and rename
#download.SRA(info, outdir, subset = 5)
```

---

download.SRA.metadata *Downloads metadata from SRA*

Description

Downloads metadata from SRA

Usage

```
download.SRA.metadata(SRP, outdir, remove.invalid = TRUE)
```

Arguments

SRP	a string, a study ID as either the SRP, ERP, DRP or PRJ of the study, examples would be "SRP226389" or "ERP116106".
outdir	directory to save file, The file will be called "SraRunInfo_SRP.csv", where SRP is the SRP argument. The directory will be created if not existing.
remove.invalid	logical, default TRUE. Remove Runs with 0 reads (spots)

Value

a data.table of the opened file

References

doi: 10.1093/nar/gkq1019

See Also

Other sra: download.SRA(), download.ebi(), install.sratoolkit(), rename.SRA.files()

Examples

```
## Originally on SRA
outdir <- tempdir() # Specify output directory
# download.SRA.metadata("SRP226389", outdir)
## ORiginally on ENA
# download.SRA.metadata("ERP116106", outdir)
```

`downstreamFromPerGroup` *Get rest of objects downstream (inclusive)*

Description

Per group get the part downstream of position. downstreamFromPerGroup(tx, startSites(threeUTRs, asGR = TRUE)) will return the 3' utrs per transcript as GRangesList, usually used for interesting parts of the transcripts.

Usage

```
downstreamFromPerGroup(
  tx,
  downstreamFrom,
  is.circular = all(isCircular(tx) %in% TRUE)
)
```

Arguments

`tx`	a `GRangesList`, usually of Transcripts to be changed
`downstreamFrom`	a vector of integers, for each group in tx, where is the new start point of first valid exon.
`is.circular`	logical, default FALSE if not any is: all(isCircular(grl) Where grl is the ranges checked. If TRUE, allow ranges to extend below position 1 on chromosome. Since circular genomes can have negative coordinates.

Details

If you don't want to include the points given in the region, use `downstreamOfPerGroup`

Value

a GRangesList of downstream part

See Also

Other GRanges: `assignFirstExonsStartSite()`, `assignLastExonsStopSite()`, `downstreamOfPerGroup()`, `upstreamFromPerGroup()`, `upstreamOfPerGroup()`

`downstreamN` *Restrict GRangesList*

Description

Will restrict GRangesList to 'N' bp downstream from the first base.

Usage

```
downstreamN(grl, firstN = 150L)
```

Arguments

`grl`	(GRangesList)
`firstN`	(integer) Allow only this many bp downstream, maximum.

Value

a GRangesList of reads restricted to firstN and tiled by 1

`downstreamOfPerGroup` *Get rest of objects downstream (exclusive)*

Description

Per group get the part downstream of position. downstreamOfPerGroup(tx, stopSites(cds, asGR = TRUE)) will return the 3' utrs per transcript as GRangesList, usually used for interesting parts of the transcripts.

Usage

```
downstreamOfPerGroup(tx, downstreamOf)
```

Arguments

`tx`	a `GRangesList`, usually of Transcripts to be changed
`downstreamOf`	a vector of integers, for each group in tx, where is the new start point of first valid exon. Can also be a GRangesList, then stopsites will be used.

Details

If you want to include the points given in the region, use downstreamFromPerGroup

Value

a GRangesList of downstream part

See Also

Other GRanges: `assignFirstExonsStartSite()`, `assignLastExonsStopSite()`, `downstreamFromPerGroup()`, `upstreamFromPerGroup()`, `upstreamOfPerGroup()`

DTEG.analysis *Run differential TE analysis*

Description

Creates a total of 3 DESeq models (given x is design argument input (usually stage or condition) and libraryType is RNA-seq and Ribo-seq):
1. Ribo-seq model: design = ~ x (differences between the x groups in Ribo-seq)
2. RNA-seq model: design = ~ x (differences between the x groups in RNA-seq)
3. TE model: design = ~ x + libraryType + libraryType:x (differences between the x and libraryType groups and the interaction between them)
Using an equal reimplementation of the deltaTE algorithm (see reference). You need at least 2 groups and 2 replicates per group. The Ribo-seq counts will be over CDS and RNA-seq over mRNAs, per transcript.

Usage

```
DTEG.analysis(
  df.rfp,
  df.rna,
  output.dir = paste0(dirname(df.rfp$filepath[1]), "/QC_STATS/"),
  design = "stage",
  p.value = 0.05,
  RFP_counts = countTable(df.rfp, "cds", type = "summarized"),
  RNA_counts = countTable(df.rna, "mrna", type = "summarized"),
  batch.effect = FALSE,
  plot.title = "",
  width = 6,
  height = 6,
  dot.size = 0.4,
  relative.name = "DTEG_plot.png"
)
```

Arguments

df.rfp	a experiment of Ribo-seq or 80S from TCP-seq.
df.rna	a experiment of RNA-seq
output.dir	output.dir directory to save plots, plot will be named "TE_between.png". If NULL, will not save.
design	a character vector, default "stage". The columns in the ORFik experiment that represent the comparison contrasts. Usually found in "stage", "condition" or "fraction" column.
p.value	a numeric, default 0.05 in interval (0,1) or "" to not show. What p-value used for the analysis? Will be shown as a caption.
RFP_counts	a SummarizedExperiment, default: countTable(df.rfp, "cds", type = "summarized"), all transcripts. Assign a subset if you don't want to analyze all genes. It is recommended to not subset, to give DESeq2 data for variance analysis.

RNA_counts	a SummarizedExperiment, default: countTable(df.rna, "mrna", type = "summarized"), all transcripts. Assign a subset if you don't want to analyze all genes. It is recommended to not subset, to give DESeq2 data for variance analysis.
batch.effect,	logical, default FALSE. If you believe you might have batch effects, set to TRUE, will use replicate column to represent batch effects. Batch effect usually means that you have a strong variance between biological replicates. Check PCA plot on count tables to verify if you need to set it to TRUE.
plot.title	title for plots, usually name of experiment etc
width	numeric, default 6 (in inches)
height	numeric, default 6 (in inches)
dot.size	numeric, default 0.4, size of point dots in plot.
relative.name	character, Default: "DTEG_plot.png". Relative name of file to be saved in folder specified in output.dir. Change to .pdf if you want pdf file instead of png.

Details

#' If you do not need isoform variants, subset to longest isoform in the returned object (See examples). If you do not have RNA-seq controls, you can still use DESeq on Ribo-seq alone.
The LFC values are shrunken by lfcShrink(type = "normal").

What the deltaTE plot calls intensified is here called mRNA abundance and forwarded is called Buffering.
Remember that DESeq by default can not do global change analysis, it can only find subsets with change in LFC.

Value

a data.table with 9 columns. (log fold changes, p.ajust values, group, regulation status and gene id)

References

doi: 10.1002/cpmb.108

See Also

Other TE: DTEG.plot(), te.table(), te_rna.plot()

Examples

```
## Simple example
#df.rfp <- read.experiment("Riboseq")
#df.rna <- read.experiment("RNAseq")
#dt <- DTEG.analysis(df.rfp, df.rna)
## Restrict DTEGs by log fold change (LFC):
## subset to abs(LFC) < 1.5 for both rfp and rna
#dt[abs(rfp) < 1.5 & abs(rna) < 1.5, Regulation := "No change"]

## Only longest isoform per gene:
#tx_longest <- filterTranscripts(df.rfp, 0, 1, 0)
#dt <- dt[id %in% tx_longest,]
## Convert to gene id
#dt[, id := txNamesToGeneNames(id, df.rfp)]
## To get by gene symbol, use biomaRt conversion
```

DTEG.plot *Plot DTEG result*

Description

Plot DTEG result

Usage

```
DTEG.plot(
  dt,
  output.dir = NULL,
  p.value = 0.05,
  plot.title = "",
  width = 6,
  height = 6,
  dot.size = 0.4,
  xlim = c(-5, 5),
  ylim = c(-10, 10),
  relative.name = "DTEG_plot.png"
)
```

Arguments

dt	a data.table with the results from DTEG.analysis
output.dir	a character path, default NULL(no save), or a directory to save to a file will be called "DTEG_plot.png"
p.value	a numeric, default 0.05 in interval (0,1) or "" to not show. What p-value used for the analysis? Will be shown as a caption.
plot.title	title for plots, usually name of experiment etc
width	numeric, default 6 (in inches)
height	numeric, default 6 (in inches)
dot.size	numeric, default 0.4, size of point dots in plot.
xlim	numeric vector, default c(-5, 5)
ylim	numeric vector, default c(-10, 10)
relative.name	character, Default: "DTEG_plot.png". Relative name of file to be saved in folder specified in output.dir. Change to .pdf if you want pdf file instead of png.

Value

a ggplot object

See Also

Other TE: DTEG.analysis(), te.table(), te_rna.plot()

Examples

```
#df.rfp <- read.experiment("Riboseq")
#df.rna <- read.experiment("RNAseq")
#dt <- DTEG.analysis(df.rfp, df.rna)
#DTEG.plot(dt, xlim = c(-2, 2), ylim = c(-2, 2))
```

`entropy` *Percentage of maximum entropy*

Description

Calculates entropy of the 'reads' coverage over each 'grl' group. The entropy value per group is a real number in the interval (0:1), where 0 indicates no variance in reads over group. For example c(0,0,0,0) has 0 entropy, since no reads overlap.

Usage

```
entropy(grl, reads, weight = 1L, is.sorted = FALSE, overlapGrl = NULL)
```

Arguments

`grl`	a `GRangesList` object can be either transcripts, 5' utrs, cds', 3' utrs or ORFs as a special case (uORFs, potential new cds' etc). If regions are not spliced you can send a `GRanges` object.
`reads`	a `GAlignments`, `GRanges` or `GRangesList` object, usually of RiboSeq, RnaSeq, CageSeq, etc.
`weight`	a vector (default: 1L, if 1L it is identical to countOverlaps()), if single number (!= 1), it applies for all, if more than one must be equal size of 'reads'. else it must be the string name of a defined meta column in subject "reads", that gives number of times a read was found. GRanges("chr1", 1, "+", score = 5), would mean "score" column tells that this alignment region was found 5 times.
`is.sorted`	logical (FALSE), is grl sorted. That is + strand groups in increasing ranges (1,2,3), and - strand groups in decreasing ranges (3,2,1)
`overlapGrl`	an integer, (default: NULL), if defined must be countOverlaps(grl, RFP), added for speed if you already have it

Value

A numeric vector containing one entropy value per element in 'grl'

See Also

Other features: `computeFeaturesCage()`, `computeFeatures()`, `countOverlapsW()`, `disengagementScore()`, `distToCds()`, `distToTSS()`, `floss()`, `fpkm_calc()`, `fpkm()`, `fractionLength()`, `initiationScore()`, `insideOutsideORF()`, `isInFrame()`, `isOverlapping()`, `kozakSequenceScore()`, `orfScore()`, `rankOrder()`, `ribosomeReleaseScore()`, `ribosomeStallingScore()`, `startRegionCoverage()`, `startRegion()`, `stopRegion()`, `subsetCoverage()`, `translationalEff()`

Examples

```
# a toy example with ribo-seq p-shifted reads
ORF <- GRanges("1", ranges = IRanges(start = c(1, 12, 22),
                                     end = c(10, 20, 32)),
               strand = "+",
               names = rep("tx1_1", 3))
names(ORF) <- rep("tx1", 3)
grl <- GRangesList(tx1_1 = ORF)
reads <- GRanges("1", IRanges(c(25, 35), c(25, 35)), "+")
# grl must have same names as cds + _1 etc, so that they can be matched.
entropy(grl, reads)
# or on cds
cdsORF <- GRanges("1", IRanges(35, 44), "+", names = "tx1")
names(cdsORF) <- "tx1"
cds <-  GRangesList(tx1 = cdsORF)
entropy(cds, reads)
```

---

exists.ftp.file.fast *A copy of biomartr ftp check*

Description

Will be removed when biomartr::exists.ftp.file.new is pushed to CRAN stable

Usage

```
exists.ftp.file.fast(url, file.path)
```

Arguments

url	character, full path directory of url
file.path	character, full path url to file

Value

logical, TRUE if file exists

---

experiment-class *experiment class definition*

Description

It is an object to massivly simplify your coding, by having a table of all libraries of an experiment. That contains filepaths and info for each library in the experiment. It also tries to guess grouping / types / pairs by the file names.
Act as a way of extension of SummarizedExperiment by allowing more ease to find not only counts, but rather information about libraries, and annotation, so that more tasks are possible. Like coverage per position in some transcript etc.

Constructor:
Simplest way to make is to call:
create.experiment(dir)
On some folder with NGS libraries (usually bam files) and see what you get. Some of the fields might be needed to fill in manually. Each resulting row must be unique (not including filepath, they are always unique), that means if it has replicates then that must be said explicit. And all filepaths must be unique and have files with size > 0.

Here all the columns in the experiment will be described: name (column info): examples

libtype library type: rna-seq, ribo-seq, CAGE etc

stage stage or tissue: 64cell, Shield, HEK293

rep replicate: 1,2,3 etc

condition treatment or condition: : WT (wild-type), control, target, mzdicer, starved

fraction fraction of total: 18, 19 (TCP / RCP fractions), or other ways to split library.

filepath Full filepath to file

reverse optional: 2nd filepath or info, only used if paired files

Details

Special rules:
Supported:
Single/paired end bam, bed, wig, ofst + compressions of these
The reverse column of the experiments says "paired-end" if bam file. If a pair of wig files, forward and reverse strand, reverse is filepath to '-' strand wig file. Paired forward / reverse wig files, must have same name except _forward / _reverse in name
Paired end bam, when creating experiment, set pairedEndBam = c(T, T, T, F). For 3 paired end libraries, then one single end.
Naming: Will try to guess naming for tissues / stages, replicates etc. If it finds more than one hit for one file, it will not guess. Always check that it guessed correctly.

See Also

Other ORFik_experiment: `ORFik.template.experiment()`, `bamVarName()`, `create.experiment()`, `filepath()`, `libraryTypes()`, `organism.df()`, `outputLibs()`, `read.experiment()`, `save.experiment()`, `validateExperiments()`

Examples

```
## To see an internal ORFik example
df <- ORFik.template.experiment()
## See libraries in experiment
df
## See organism of experiment
organism.df(df)
## See file paths in experiment
filepath(df, "default")
## Output objects in R, to .GlobalEnv
#outputLibs(df)

## This is how to make it:
```

```
## Not run:
library(ORFik)

# 1. Update path to experiment data  directory (bam, bed, wig files etc)
exp_dir = "/data/processed_data/RNA-seq/Lee_zebrafish_2013/aligned/"

# 2. Set a short character name for experiment, (Lee et al 2013 -> Lee13, etc)
exper_name = "Lee13"

# 3. Create a template experiment (gtf and fasta genome)
temp <- create.experiment(exp_dir, exper_name, saveDir = NULL,
 txdb = "/data/references/Zv9_zebrafish/Danio_rerio.Zv9.79.gtf",
 fa = "/data/references/Zv9_zebrafish/Danio_rerio.Zv9.fa",
 organism = "Homo sapiens")

# 4. Make sure each row(sample) is unique and correct
# You will get a view open now, check the data.frame that it is correct:
# library type (RNA-seq, Ribo-seq), stage, rep, condition, fraction.
# Let say it did not figure out it is RNA-seq, then we do:"

temp[5:6, 1] <- "RNA" # [row 5 and 6, col 1] are library types

# You can also do this in your spread sheet program (excel, libre office)
# Now save new version, if you did not use spread sheet.
saveName <- paste0("/data/processed_data/experiment_tables_for_R/",
 exper_name,".csv")
save.experiment(temp, saveName)

# 5. Load experiment, this will validate that you actually made it correct
df <- read.experiment(saveName)

# Set experiment name not to be assigned in R variable names
df@expInVarName <- FALSE
df

## End(Not run)
```

`experiment.colors` *Decide color for libraries by grouping*

Description

Pick the grouping wanted for colors, by default only group by libtype. Like RNA-seq(skyblue4) and Ribo-seq(orange).

Usage

```
experiment.colors(
  df,
  color_list = "default",
  skip.libtype = FALSE,
  skip.stage = TRUE,
  skip.replicate = TRUE,
  skip.fraction = TRUE,
```

```
  skip.condition = TRUE
)
```

Arguments

df	an ORFik experiment
color_list	a character vector of colors, default "default". That is the vector c("skyblue4", 'orange', "green", "red", "gray", "yellow", "blue", "red2", "orange3"). Picks number of colors needed to make groupings have unique color
skip.libtype	a logical (FALSE), don't include libtype
skip.stage	a logical (FALSE), don't include stage in variable name.
skip.replicate	a logical (FALSE), don't include replicate in variable name.
skip.fraction	a logical (FALSE), don't include fraction
skip.condition	a logical (FALSE), don't include condition in variable name.

Value

a character vector of colors

---

export.bed12 *Export as bed12 format*

Description

bed format for multiple exons per group, as transcripts. Can be use as alternative as a sparse .gff format for ORFs. Can be direct input for ucsc browser or IGV

Usage

```
export.bed12(grl, file, rgb = 0)
```

Arguments

grl	A GRangesList
file	a character path to valid output file name
rgb	integer vector, default (0), either single integer or vector of same size as grl to specify groups. It is adviced to not use more than 8 different groups

Details

If grl has no names, groups will be named 1,2,3,4..

Value

NULL (File is saved as .bed)

See Also

Other utils: bedToGR(), convertToOneBasedRanges(), export.wiggle(), fimport(), findFa(), fread.bed(), optimizeReads(), readBam(), readWig()

Examples

```
grl <- GRangesList(GRanges("1", c(1,3,5), "+"))
# export.bed12(grl, "output/path/orfs.bed")
```

---

export.bedo *Store GRanges object as .bedo*

Description

.bedo is .bed ORFik, an optimized bed format for coverage reads with read lengths .bedo is a text based format with columns (6 maximum):
1. chromosome
2. start
3. end
4. strand
5. ref width (cigar # M's, match/mismatch total)
6. duplicates of that read

Usage

```
export.bedo(object, out)
```

Arguments

object	a GRanges object
out	a character, location on disc (full path)

Details

Positions are 1-based, not 0-based as .bed. End will be removed if all ends equals all starts. Import with import.bedo

Value

NULL, object saved to disc

---

export.bedoc *Store GAlignments object as .bedoc*

Description

A much faster way to store, load and use bam files.
.bedoc is .bed ORFik, an optimized bed format for coverage reads with cigar and replicate number.
.bedoc is a text based format with columns (5 maximum):
1. chromosome
2. cigar: (cigar # M's, match/mismatch total)
3. start (left most position)
4. strand (+, -, *)
5. score: duplicates of that read

Usage

```
export.bedoc(object, out)
```

Arguments

object	a GAlignments object
out	a character, location on disc (full path)

Details

Positions are 1-based, not 0-based as .bed. Import with import.bedoc

Value

NULL, object saved to disc

---

export.ofst *Store GRanges / GAlignments object as .ofst*

Description

A much faster way to store, load and use bam files.
.ofst is ORFik fast serialized object, an optimized format for coverage reads with cigar and replicate number. It uses the fst format as back-end: fst-package.
A .ofst ribo seq file can compress the information in a bam file from 5GB down to a few MB. This new files has super fast reading time, only a few seconds, instead of minutes. It also has random index access possibility of the file.
.ofst is represented as a data.frane format with minimum 4 columns:
1. chromosome
2. start (left most position)
3. strand (+, -, *)
4. width (not added if cigar exists)
5. cigar (not needed if width exists): (cigar # M's, match/mismatch total)
5. score: duplicates of that read
6. size: qwidth according to reference of read

If file is from GAlignmentPairs, it will contain a cigar1, cigar2 instead of cigar and start1 and start2 instead of start

Usage

```
export.ofst(x, ...)
```

Arguments

x	a GRanges, GAlignments or GAlignmentPairs object
...	additional arguments for write_fst

Details

Other columns can be named whatever you want and added to meta columns. Positions are 1-based, not 0-based as .bed. Import with import.ofst

Value

NULL, object saved to disc

Examples

```
## GRanges
gr <- GRanges("1:1-3:-")
# export.ofst(gr, file = "path.ofst")
## GAlignment
# Make input data.frame
df <- data.frame(seqnames = "1", cigar = "3M", start = 1L, strand = "+")
ga <- ORFik:::getGAlignments(df)
# export.ofst(ga, file = "path.ofst")
```

---

export.ofst,GAlignmentPairs-method

Store GRanges / GAlignments object as .ofst

Description

A much faster way to store, load and use bam files.
.ofst is ORFik fast serialized object, an optimized format for coverage reads with cigar and replicate number. It uses the fst format as back-end: fst-package.
A .ofst ribo seq file can compress the information in a bam file from 5GB down to a few MB. This new files has super fast reading time, only a few seconds, instead of minutes. It also has random index access possibility of the file.
.ofst is represented as a data.frane format with minimum 4 columns:
1. chromosome
2. start (left most position)
3. strand (+, -, *)
4. width (not added if cigar exists)
5. cigar (not needed if width exists): (cigar # M's, match/mismatch total)
5. score: duplicates of that read
6. size: qwidth according to reference of read

If file is from GAlignmentPairs, it will contain a cigar1, cigar2 instead of cigar and start1 and start2 instead of start

Usage

```
## S4 method for signature 'GAlignmentPairs'
export.ofst(x, file, ...)
```

Arguments

x	a GRanges, GAlignments or GAlignmentPairs object
file	a character, location on disc (full path)
...	additional arguments for write_fst

Details

Other columns can be named whatever you want and added to meta columns. Positions are 1-based, not 0-based as .bed. Import with import.ofst

Value

NULL, object saved to disc

Examples

```
## GRanges
gr <- GRanges("1:1-3:-")
# export.ofst(gr, file = "path.ofst")
## GAlignment
# Make input data.frame
df <- data.frame(seqnames = "1", cigar = "3M", start = 1L, strand = "+")
ga <- ORFik:::getGAlignments(df)
# export.ofst(ga, file = "path.ofst")
```

---

export.ofst,GAlignments-method

Store GRanges / GAlignments object as .ofst

Description

A much faster way to store, load and use bam files.
.ofst is ORFik fast serialized object, an optimized format for coverage reads with cigar and replicate number. It uses the fst format as back-end: fst-package.
A .ofst ribo seq file can compress the information in a bam file from 5GB down to a few MB. This new files has super fast reading time, only a few seconds, instead of minutes. It also has random index access possibility of the file.
.ofst is represented as a data.frane format with minimum 4 columns:
1. chromosome
2. start (left most position)
3. strand (+, -, *)
4. width (not added if cigar exists)
5. cigar (not needed if width exists): (cigar # M's, match/mismatch total)
5. score: duplicates of that read
6. size: qwidth according to reference of read

If file is from GAlignmentPairs, it will contain a cigar1, cigar2 instead of cigar and start1 and start2 instead of start

Usage

```
## S4 method for signature 'GAlignments'
export.ofst(x, file, ...)
```

Arguments

x	a GRanges, GAlignments or GAlignmentPairs object
file	a character, location on disc (full path)
...	additional arguments for write_fst

Details

Other columns can be named whatever you want and added to meta columns. Positions are 1-based, not 0-based as .bed. Import with import.ofst

Value

NULL, object saved to disc

Examples

```
## GRanges
gr <- GRanges("1:1-3:-")
# export.ofst(gr, file = "path.ofst")
## GAlignment
# Make input data.frame
df <- data.frame(seqnames = "1", cigar = "3M", start = 1L, strand = "+")
ga <- ORFik:::getGAlignments(df)
# export.ofst(ga, file = "path.ofst")
```

---

export.ofst,GRanges-method

Store GRanges / GAlignments object as .ofst

Description

A much faster way to store, load and use bam files.
.ofst is ORFik fast serialized object, an optimized format for coverage reads with cigar and replicate number. It uses the fst format as back-end: fst-package.
A .ofst ribo seq file can compress the information in a bam file from 5GB down to a few MB. This new files has super fast reading time, only a few seconds, instead of minutes. It also has random index access possibility of the file.
.ofst is represented as a data.frane format with minimum 4 columns:
1. chromosome
2. start (left most position)
3. strand (+, -, *)
4. width (not added if cigar exists)
5. cigar (not needed if width exists): (cigar # M's, match/mismatch total)
5. score: duplicates of that read
6. size: qwidth according to reference of read

If file is from GAlignmentPairs, it will contain a cigar1, cigar2 instead of cigar and start1 and start2 instead of start

Usage

```
## S4 method for signature 'GRanges'
export.ofst(x, file, ...)
```

Arguments

x	a GRanges, GAlignments or GAlignmentPairs object
file	a character, location on disc (full path)
...	additional arguments for write_fst

Details

Other columns can be named whatever you want and added to meta columns. Positions are 1-based, not 0-based as .bed. Import with import.ofst

Value

NULL, object saved to disc

Examples

```
## GRanges
gr <- GRanges("1:1-3:-")
# export.ofst(gr, file = "path.ofst")
## GAlignment
# Make input data.frame
df <- data.frame(seqnames = "1", cigar = "3M", start = 1L, strand = "+")
ga <- ORFik:::getGAlignments(df)
# export.ofst(ga, file = "path.ofst")
```

---

export.wiggle *Export as wiggle format*

Description

Will create 2 files, 1 for + strand (*_forward.wig) and 1 for - strand (*_reverse.wig). If all files are * stranded, will output 1 file. Can be direct input for ucsc browser or IGV

Usage

```
export.wiggle(x, file)
```

Arguments

x	A GRangesList, GAlignment GAlignmentPairs with score column. Will be converted to 5' end position of original range. If score column does not exist, will group ranges and give replicates as score column.
file	a character path to valid output file name

Value

invisible(NULL) (File is saved as 2 .wig files)

References

https://genome.ucsc.edu/goldenPath/help/wiggle.html

See Also

Other utils: bedToGR(), convertToOneBasedRanges(), export.bed12(), fimport(), findFa(), fread.bed(), optimizeReads(), readBam(), readWig()

Examples

```
x <- c(GRanges("1", c(1,3,5), "-"), GRanges("1", c(1,3,5), "+"))
# export.wiggle(x, "output/path/rna.wig")
```

`extendLeaders` *Extend the leaders transcription start sites.*

Description

Will extend the leaders or transcripts upstream (5' end) by extension. The extension is general not relative, that means splicing will not be taken into account. Requires the `grl` to be sorted beforehand, use `sortPerGroup` to get sorted grl.

Usage

```
extendLeaders(
  grl,
  extension = 1000L,
  cds = NULL,
  is.circular = all(isCircular(grl) %in% TRUE)
)
```

Arguments

`grl`	usually a `GRangesList` of 5' utrs or transcripts. Can be used for any extension of groups.
`extension`	an integer, how much to extend upstream (5' end). Eiter single value that will apply for all, or same as length of grl which will give 1 update value per grl object. Or a GRangesList where start / stops by strand are the positions to use as new starts.
`cds`	a `GRangesList` of coding sequences, If you want to extend 5' leaders downstream, to catch upstream ORFs going into cds, include it. It will add first cds exon to grl matched by names. Do not add for transcripts, as they are already included.
`is.circular`	logical, default FALSE if not any is: all(isCircular(grl) Where grl is the ranges checked. If TRUE, allow ranges to extend below position 1 on chromosome. Since circular genomes can have negative coordinates.

Value

an extended GRangeslist

See Also

Other ExtendGenomicRanges: `asTX()`, `coveragePerTiling()`, `extendTrailers()`, `reduceKeepAttr()`, `tile1()`, `txSeqsFromFa()`, `windowPerGroup()`

Examples

```
library(GenomicFeatures)
samplefile <- system.file("extdata", "hg19_knownGene_sample.sqlite",
                          package = "GenomicFeatures")
txdb <- loadDb(samplefile)
fiveUTRs <- fiveUTRsByTranscript(txdb, use.names = TRUE) # <- extract only 5' leaders
tx <- exonsBy(txdb, by = "tx", use.names = TRUE)
cds <- cdsBy(txdb,"tx",use.names = TRUE)
## extend leaders upstream 1000
extendLeaders(fiveUTRs, extension = 1000)
## now try(extend upstream 1000, add all cds exons):
extendLeaders(fiveUTRs, extension = 1000, cds)

## when extending transcripts, don't include cds' of course,
## since they are already there
extendLeaders(tx, extension = 1000)
## Circular genome (allow negative coordinates)
circular_fives <- fiveUTRs
isCircular(circular_fives) <- rep(TRUE, length(isCircular(circular_fives)))
extendLeaders(circular_fives, extension = 32672841L)
```

---

extendsTSSexons *Extend first exon of each transcript with length specified*

Description

Extend first exon of each transcript with length specified

Usage

```
extendsTSSexons(fiveUTRs, extension = 1000)
```

Arguments

fiveUTRs	The 5' leader sequences as GRangesList
extension	The number of basses to extend transcripts upstream

Value

GRangesList object of fiveUTRs

`extendTrailers` *Extend the Trailers transcription stop sites*

Description

Will extend the trailers or transcripts downstream (3' end) by extension. The extension is general not relative, that means splicing will not be taken into account. Requires the `grl` to be sorted beforehand, use `sortPerGroup` to get sorted grl.

Usage

```
extendTrailers(
  grl,
  extension = 1000L,
  is.circular = all(isCircular(grl) %in% TRUE)
)
```

Arguments

`grl`	usually a `GRangesList` of 3' utrs or transcripts. Can be used for any extension of groups.
`extension`	an integer, how much to extend downstream (3' end). Eiter single value that will apply for all, or same as length of grl which will give 1 update value per grl object. Or a GRangesList where start / stops sites by strand are the positions to use as new starts.
`is.circular`	logical, default FALSE if not any is: all(isCircular(grl) Where grl is the ranges checked. If TRUE, allow ranges to extend below position 1 on chromosome. Since circular genomes can have negative coordinates.

Value

an extended GRangeslist

See Also

Other ExtendGenomicRanges: `asTX()`, `coveragePerTiling()`, `extendLeaders()`, `reduceKeepAttr()`, `tile1()`, `txSeqsFromFa()`, `windowPerGroup()`

Examples

```
library(GenomicFeatures)
samplefile <- system.file("extdata", "hg19_knownGene_sample.sqlite",
                          package = "GenomicFeatures")
txdb <- loadDb(samplefile)
threeUTRs <- threeUTRsByTranscript(txdb) # <- extract only 5' leaders
tx <- exonsBy(txdb, by = "tx", use.names = TRUE)
## now try(extend downstream 1000):
extendTrailers(threeUTRs, extension = 1000)
## Or on transcripts
extendTrailers(tx, extension = 1000)
## Circular genome (allow negative coordinates)
circular_three <- threeUTRs
```

```
isCircular(circular_three) <- rep(TRUE, length(isCircular(circular_three)))
extendTrailers(circular_three, extension = 126200008L)[41] # <- negative stop coordinate
```

`filepath` *Get filepaths to ORFik experiment*

Description

If other type than "default" is given and that type is not found, it will return you default filepaths without warning.

Usage

```
filepath(df, type, basename = FALSE)
```

Arguments

`df`	an ORFik `experiment`
`type`	a character(default: "default"), load files in experiment or some precomputed variant, either "ofst", "bedo", "bedoc" or "pshifted". These are made with ORFik:::convertLibs() or shiftFootprintsByExperiment(). Can also be custom user made folders inside the experiments bam folder.
`basename`	logical, default (FALSE). Get relative paths instead of full. Only use for inspection!

Details

For pshifted libraries, it will load ".bedo" prioritized over ".bed", if there exists both file types for the same file.

Value

a character vector of paths, or a list of character with 2 paths per, if paired libraries exists

See Also

Other ORFik_experiment: `ORFik.template.experiment()`, `bamVarName()`, `create.experiment()`, `experiment-class`, `libraryTypes()`, `organism.df()`, `outputLibs()`, `read.experiment()`, `save.experiment()`, `validateExperiments()`

Examples

```
df <- ORFik.template.experiment()
filepath(df, "default")
# If you have bedo files, see simpleLibs():
# filepath(df, "bedo")
# If you have pshifted files, see shiftFootprintsByExperiment():
# filepath(df, "pshifted")
```

filterCage *Filter peak of cage-data by value*

Description

Filter peak of cage-data by value

Usage

```
filterCage(cage, filterValue = 1, fiveUTRs = NULL, preCleanup = TRUE)
```

Arguments

cage	Either a filePath for the CageSeq file as .bed .bam or .wig, with possible compressions (".gzip", ".gz", ".bgz"), or already loaded CageSeq peak data as GRanges or GAlignment. NOTE: If it is a .bam file, it will add a score column by running: convertToOneBasedRanges(cage, method = "5prime", addScoreColumn = TRUE) The score column is then number of replicates of read, if score column is something else, like read length, set the score column to NULL first.
filterValue	The minimum number of reads on cage position, for it to be counted as possible new tss. (represented in score column in CageSeq data) If you already filtered, set it to 0.
fiveUTRs	a GRangesList (NULL), if added will filter out cage reads by these following rules: all reads in region (-5:-1, 1:5) for each tss will be removed, removes noise.
preCleanup	logical (TRUE), if TRUE, remove all reads in region (-5:-1, 1:5) of all original tss in leaders. This is to keep original TSS if it is only +/- 5 bases from the original.

Value

the filtered Granges object

filterExtremePeakGenes *Filter out transcript by a median filter*

Description

For removing very extreme peaks in coverage plots, use high quantiles, like 99. Used to make your plots look better, by removing extreme peaks.

Usage

```
filterExtremePeakGenes(
  tx,
  reads,
  upstream = NULL,
  downstream = NULL,
  multiplier = "0.99",
  min_cutoff = "0.999",
  pre_filter_minimum = 0,
  average = "median"
)
```

Arguments

tx	a GRangesList
reads	a GAlignments or GRanges
upstream	numeric or NULL, default NULL. if you want window of tx, instead of whole, specify how much upstream from start of tx, 10 is include 10 bases before start
downstream	numeric or NULL, default NULL. if you want window of tx, instead of whole, specify how much downstream from start of tx, 10 is go 10 bases into tx from start.
multiplier	a character or numeric, default "0.99", either a quantile if input is string[0-1], like "0.99", or numeric value if input is numeric. How much bigger than median / mean counts per gene, must a value be to be defined as extreme ?
min_cutoff	a character or numeric, default "0.999", either a quantile if input is string[0-1], like "0.999", or numeric value if input is numeric. Lowest allowed value
pre_filter_minimum	numeric, default 0. If value is x, will remove all positions in all genes with coverage < x, before median filter is applied. Set to 1 to remove all 0 positions.
average	character, default "median". Alternative: "mean". How to scale the multiplier argument, from median or mean of gene coverage.

Value

GRangesList (filtered)

---

filterTranscripts *Filter transcripts by lengths*

Description

Filter transcripts to those who have leaders, CDS, trailers of some lengths, you can also pick the longest per gene.

Usage

```
filterTranscripts(
  txdb,
  minFiveUTR = 30L,
  minCDS = 150L,
  minThreeUTR = 30L,
  longestPerGene = TRUE,
  stopOnEmpty = TRUE,
  by = "tx"
)
```

Arguments

txdb	a TxDb file or a path to one of: (.gtf ,.gff, .gff2, .gff2, .db or .sqlite), if it is a GRangesList, it will return it self.
minFiveUTR	(integer) minimum bp for 5' UTR during filtering for the transcripts. Set to NULL if no 5' UTRs exists for annotation.
minCDS	(integer) minimum bp for CDS during filtering for the transcripts
minThreeUTR	(integer) minimum bp for 3' UTR during filtering for the transcripts. Set to NULL if no 3' UTRs exists for annotation.
longestPerGene	logical (TRUE), return only longest valid transcript per gene. NOTE: This is by priority longest cds isoform, if equal then pick longest total transcript. So if transcript is shorter but cds is longer, it will still be the one returned.
stopOnEmpty	logical TRUE, stop if no valid transcripts are found ?
by	a character, default "tx" Either "tx" or "gene". What names to output region by, the transcript name "tx" or gene names "gene"

Details

If a transcript does not have a trailer, then the length is 0, so they will be filtered out if you set minThreeUTR to 1. So only transcripts with leaders, cds and trailers will be returned. You can set the integer to 0, that will return all within that group.

If your annotation does not have leaders or trailers, set them to NULL, since 0 does mean there must exist a column called utr3_len etc. Genes with gene_id = NA will be be removed.

Value

a character vector of valid transcript names

Examples

```
gtf_file <- system.file("extdata", "annotations.gtf", package = "ORFik")
txdb <- GenomicFeatures::makeTxDbFromGFF(gtf_file)
txNames <- filterTranscripts(txdb, minFiveUTR = 1, minCDS = 30,
                             minThreeUTR = 1)
loadRegion(txdb, "mrna")[txNames]
loadRegion(txdb, "5utr")[txNames]
```

filterUORFs *Remove uORFs that are false CDS hits*

Description

This is a strong filtering, so that even if the cds is on another transcript , the uORF is filtered out, this is because there is no way of knowing by current ribo-seq, rna-seq experiments.

Usage

```
filterUORFs(uorfs, cds)
```

Arguments

uorfs	(GRangesList), the uORFs to filter
cds	(GRangesList), the coding sequences (main ORFs on transcripts), to filter against.

Value

(GRangesList) of filtered uORFs

See Also

Other uorfs: addCdsOnLeaderEnds(), removeORFsWithSameStartAsCDS(), removeORFsWithSameStopAsCDS(), removeORFsWithStartInsideCDS(), removeORFsWithinCDS(), uORFSearchSpace()

fimport *Load any type of sequencing reads*

Description

Wraps around rtracklayer::import and tries to speed up loading with the use of data.table. Supports gzip, gz, bgz compression formats. Also safer chromosome naming with the argument chrStyle

Usage

```
fimport(path, chrStyle = NULL, param = NULL, strandMode = 0)
```

Arguments

path	a character path to file (1 or 2 files), or data.table with 2 colums(forward&reverse) or a GRanges/Galignment/GAlignmentPairs object etc. If it is ranged object it will presume to be already loaded, so will return the object as it is, updating the seqlevelsStyle if given.
chrStyle	a GRanges object, TxDb, FaFile, or a seqlevelsStyle (Default: NULL) to get seqlevelsStyle from. Is chromosome 1 called chr1 or 1, is mitocondrial chromosome called MT or chrM etc. Will use 1st seqlevel-style if more are present. Like: c("NCBI", "UCSC") -> pick "NCBI"

param — NULL or a ScanBamParam object. Like for scanBam, this influences what fields and which records are imported. However, note that the fields specified thru this ScanBamParam object will be loaded *in addition* to any field required for generating the returned object (GAlignments, GAlignmentPairs, or GappedReads object), but only the fields requested by the user will actually be kept as metadata columns of the object.

By default (i.e. param=NULL or param=ScanBamParam()), no additional field is loaded. The flag used is scanBamFlag(isUnmappedQuery=FALSE) for readGAlignments, readGAlignmentsList, and readGappedReads. (i.e. only records corresponding to mapped reads are loaded), and scanBamFlag(isUnmappedQuery=FALSE,isPaired=TRUE,has
for readGAlignmentPairs (i.e. only records corresponding to paired-end reads with both ends mapped are loaded).

strandMode — numeric, default 0. Only used for paired end bam files. One of (0: strand = *, 1: first read of pair is +, 2: first read of pair is -). See ?strandMode. Note: Sets default to 0 instead of 1, as readGAlignmentPairs uses 1. This is to guarantee hits, but will also make mismatches of overlapping transcripts in opposite directions.

Details

NOTE: For wig you can send in 2 files, so that it automaticly merges forward and reverse stranded objects. You can also just send 1 wig file, it will then have "*" as strand.

Value

a GAlignments/GRanges object, depending on input.

See Also

Other utils: bedToGR(), convertToOneBasedRanges(), export.bed12(), export.wiggle(), findFa(), fread.bed(), optimizeReads(), readBam(), readWig()

Examples

```
bam_file <- system.file("extdata", "ribo-seq.bam", package = "ORFik")
fimport(bam_file)
# Certain chromosome naming
fimport(bam_file, "NCBI")
# Paired end bam strandMode 1:
fimport(bam_file, strandMode = 1)
# (will have no effect in this case, since it is not paired end)
```

---

findFa *Convenience wrapper for Rsamtools FaFile*

Description

Get fasta file object, to find sequences in file.
Will load and import file if necessarry.

Usage

```
findFa(faFile)
```

Arguments

faFile	FaFile, BSgenome, fasta/index file path or an ORFik experiment. This file is usually used to find the transcript sequences from some GRangesList.

Value

a FaFile or BSgenome

See Also

Other utils: bedToGR(), convertToOneBasedRanges(), export.bed12(), export.wiggle(), fimport(), fread.bed(), optimizeReads(), readBam(), readWig()

Examples

```
# Some fasta genome with existing fasta index in same folder
path <- system.file("extdata", "genome.fasta", package = "ORFik")
findFa(path)
```

---

findFromPath *Find all candidate library types filenames*

Description

From the given experiment

Usage

```
findFromPath(filepaths, candidates, slot = "auto")
```

Arguments

filepaths	path to all files
candidates	a data.table with 2 columns, Possible names to search for, see experiment_naming family for candidates.
slot	character, default "auto". If auto, use auto guessing of slot, else must be a character vector of length 1 or equal length as filepaths.

Value

a candidate library types (character vector)

findLibrariesInFolder *Get all library files in folder/folders of given types*

Description

Will try to guess paired / unpaired wig, bed, bam files.

Usage

```
findLibrariesInFolder(dir, types, pairedEndBam = FALSE)
```

Arguments

dir	Which directory / directories to create experiment from
types	Default (bam, bed, wig), which types of libraries to allow
pairedEndBam	logical FALSE, else TRUE, or a logical list of TRUE/FALSE per library you see will be included (run first without and check what order the files will come in) 1 paired end file, then two single will be c(T, F, F). If you have a SRA metadata csv file, you can set this argument to study$LibraryLayout == "PAIRED", where study is the SRA metadata for all files that was aligned.

Details

Set pairedEndBam if you have paired end reads as a single bam file.

Value

(data.table) All files found from types parameter. With 2 extra column (logical), is it wig pairs, and paired bam files.

findMapORFs *Find ORFs and immediately map them to their genomic positions.*

Description

This function can map spliced ORFs. It finds ORFs on the sequences of interest, but returns relative positions to the positions of ‘grl‘ argument. For example, ‘grl‘ can be exons of known transcripts (with genomic coordinates), and ‘seq‘ sequences of those transcripts, in that case, this function will return genomic coordinates of ORFs found on transcript sequences.

Usage

```
findMapORFs(
  grl,
  seqs,
  startCodon = startDefinition(1),
  stopCodon = stopDefinition(1),
  longestORF = TRUE,
  minimumLength = 0,
  groupByTx = FALSE
)
```

Arguments

grl	(GRangesList) of sequences to search for ORFs, probably in genomic coordinates
seqs	(DNAStringSet or character vector) - DNA/RNA sequences to search for Open Reading Frames. Can be both uppercase or lowercase. Easiest call to get seqs if you want only regions from a fasta/fasta index pair is: seqs = ORFik:::txSeqsFromFa(grl, faFile), where grl is a GRanges/List of search regions and faFile is a FaFile.
startCodon	(character vector) Possible START codons to search for. Check startDefinition for helper function.
stopCodon	(character vector) Possible STOP codons to search for. Check stopDefinition for helper function.
longestORF	(logical) Default TRUE. Keep only the longest ORF per unique stopcodon: (seqname, strand, stopcodon) combination, Note: Not longest per transcript! You can also use function longestORFs after creation of ORFs for same result.
minimumLength	(integer) Default is 0. Which is START + STOP = 6 bp. Minimum length of ORF, without counting 3bps for START and STOP codons. For example minimumLength = 8 will result in size of ORFs to be at least START + 8*3 (bp) + STOP = 30 bases. Use this param to restrict search.
groupByTx	logical (default: FALSE), should output GRangesList be grouped by exons per ORF (TRUE) or by orfs per transcript (FALSE)?

Details

This function assumes that 'seq' is in widths relative to 'grl', and that their orders match. 1st seq is 1st grl object, etc.

See vignette for real life example.

Value

A GRangesList of ORFs.

See Also

Other findORFs: findORFsFasta(), findORFs(), findUORFs(), startDefinition(), stopDefinition()

Examples

```
# First show simple example using findORFs
# This sequence has ORFs at 1-9 and 4-9
seqs <- DNAStringSet("ATGATGTAA") # the dna transcript sequence
findORFs(seqs)
# lets assume that this sequence comes from two exons as follows
# Then we need to use findMapORFs instead of findORFs,
#  for splicing information
gr <- GRanges(seqnames = rep("1", 2), # chromosome 1
              ranges = IRanges(start = c(21, 10), end = c(23, 15)),
              strand = rep("-", 2), names = rep("tx1", 2))
grl <- GRangesList(tx1 = gr)
findMapORFs(grl, seqs) # ORFs are properly mapped to its genomic coordinates

grl <- c(grl, grl)
```

```
names(grl) <- c("tx1", "tx2")
findMapORFs(grl, c(seqs, seqs))
# More advanced example and how to save sequences found in vignette
```

`findMaxPeaks` *Find max peak for each transcript, returns as data.table, without names, but with index*

Description

Find max peak for each transcript, returns as data.table, without names, but with index

Usage

```
findMaxPeaks(cageOverlaps, filteredCage)
```

Arguments

`cageOverlaps`	The cageOverlaps between cage and extended 5' leaders
`filteredCage`	The filtered raw cage-data used to reassign 5' leaders

Value

a data.table of max peaks

`findNewTSS` *Finds max peaks per trancsript from reads in the cagefile*

Description

Finds max peaks per trancsript from reads in the cagefile

Usage

```
findNewTSS(fiveUTRs, cageData, extension, restrictUpstreamToTx)
```

Arguments

`fiveUTRs`	The 5' leader sequences as GRangesList
`cageData`	The CAGE as GRanges object
`extension`	The number of basses to extends transcripts upstream.
`restrictUpstreamToTx`	a logical (FALSE), if you want to restrict leaders to not extend closer than 5 bases from closest upstream leader, set this to TRUE.

Value

a Hits object

findNGSPairs — *Find pair of forward and reverse strand wig / bed files and paired end bam files split in two*

Description

Find pair of forward and reverse strand wig / bed files and paired end bam files split in two

Usage

```
findNGSPairs(
  paths,
  f = c("forward", "fwd"),
  r = c("reverse", "rev"),
  format = "wig"
)
```

Arguments

paths	a character path at least one .wig / .bed file
f	Default (c("forward", "fwd") a character vector for forward direction regex.
r	Default (c("reverse", "rev") a character vector for reverse direction regex.
format	default "wig", for bed do "bed". Also searches compressions of these variants.

Value

if not all are paired, return original list, if they are all paired, return a data.table with matches as 2 columns

findORFs — *Find Open Reading Frames.*

Description

Find all Open Reading Frames (ORFs) on the simple input sequences in ONLY 5'- 3' direction (+), but within all three possible reading frames. Do not use findORFs for mapping to full chromosomes, then use `findMapORFs`! For each sequence of the input vector `IRanges` with START and STOP positions (inclusive) will be returned as `IRangesList`. Returned coordinates are relative to the input sequences.

Usage

```
findORFs(
  seqs,
  startCodon = startDefinition(1),
  stopCodon = stopDefinition(1),
  longestORF = TRUE,
  minimumLength = 0
)
```

Arguments

seqs	(DNAStringSet or character vector) - DNA/RNA sequences to search for Open Reading Frames. Can be both uppercase or lowercase. Easiest call to get seqs if you want only regions from a fasta/fasta index pair is: seqs = ORFik:::txSeqsFromFa(grl, faFile), where grl is a GRanges/List of search regions and faFile is a FaFile.
startCodon	(character vector) Possible START codons to search for. Check startDefinition for helper function.
stopCodon	(character vector) Possible STOP codons to search for. Check stopDefinition for helper function.
longestORF	(logical) Default TRUE. Keep only the longest ORF per unique stopcodon: (seqname, strand, stopcodon) combination, Note: Not longest per transcript! You can also use function longestORFs after creation of ORFs for same result.
minimumLength	(integer) Default is 0. Which is START + STOP = 6 bp. Minimum length of ORF, without counting 3bps for START and STOP codons. For example minimumLength = 8 will result in size of ORFs to be at least START + 8*3 (bp) + STOP = 30 bases. Use this param to restrict search.

Details

If you want antisence strand too, do: `#positive strands pos <-findORFs(seqs) #negative strands (DNAStringSet only if character) neg <-findORFs(reverseComplement(DNAStringSet(seqs))) relist(c(GRanges(pos,strand = "+"),GRanges(neg,strand = "-")),skeleton = merge(pos,neg))`

Value

(IRangesList) of ORFs locations by START and STOP sites grouped by input sequences. In a list of sequences, only the indices of the sequences that had ORFs will be returned, e.g. 3 sequences where only 1 and 3 has ORFs, will return size 2 IRangesList with names c("1", "3"). If there are a total of 0 ORFs, an empty IRangesList will be returned.

See Also

Other findORFs: findMapORFs(), findORFsFasta(), findUORFs(), startDefinition(), stopDefinition()

Examples

```
## Simple examples
findORFs("ATGTAA")
findORFs("ATGTTAA") # not in frame anymore

findORFs("ATGATGTAA") # only longest of two above
findORFs("ATGATGTAA", longestORF = FALSE) # two ORFs

findORFs(c("ATGTAA", "ATGATGTAA"))

## Get DNA sequences from ORFs
seq <- DNAStringSet(c("ATGTAA", "AAA", "ATGATGTAA"))
names(seq) <- c("tx1", "tx2", "tx3")
orfs <- findORFs(seq, longestORF = FALSE)

#  you can get sequences like this:
gr <- unlist(orfs, use.names = TRUE)
```

```
gr <- GRanges(seqnames = names(seq)[as.integer(names(gr))],
 ranges(gr), strand = "+")
# Give them some proper names:
names(gr) <- paste0("ORF_", seq.int(length(gr)), "_", seqnames(gr))
orf_seqs <- getSeq(seq, gr)
orf_seqs
# Convert to DNA DNAStringSet and Save as .fasta
# writeXStringSet(orf_seqs, "orfs.fasta")
## Reading from file and find ORFs
```

`findORFsFasta` *Finds Open Reading Frames in fasta files.*

Description

Should be used for procaryote genomes or transcript sequences as fasta. Makes no sence for eukaryote whole genomes, since those contains splicing (use findMapORFs for spliced ranges). Searches through each fasta header and reports all ORFs found for BOTH sense (+) and antisense strand (-) in all frames. Name of the header will be used as seqnames of reported ORFs. Each fasta header is treated separately, and name of the sequence will be used as seqname in returned GRanges object. This supports circular genomes.

Usage

```
findORFsFasta(
  filePath,
  startCodon = startDefinition(1),
  stopCodon = stopDefinition(1),
  longestORF = TRUE,
  minimumLength = 0,
  is.circular = FALSE
)
```

Arguments

`filePath`	(character) Path to the fasta file. Can be both uppercase or lowercase. Or a already loaded R object of either types: "BSgenome" or "DNAStringSet" with named sequences
`startCodon`	(character vector) Possible START codons to search for. Check `startDefinition` for helper function.
`stopCodon`	(character vector) Possible STOP codons to search for. Check `stopDefinition` for helper function.
`longestORF`	(logical) Default TRUE. Keep only the longest ORF per unique stopcodon: (seqname, strand, stopcodon) combination, Note: Not longest per transcript! You can also use function `longestORFs` after creation of ORFs for same result.
`minimumLength`	(integer) Default is 0. Which is START + STOP = 6 bp. Minimum length of ORF, without counting 3bps for START and STOP codons. For example minimumLength = 8 will result in size of ORFs to be at least START + 8*3 (bp) + STOP = 30 bases. Use this param to restrict search.

`is.circular` (logical) Whether the genome in filePath is circular. Prokaryotic genomes are usually circular. Be carefull if you want to extract sequences, remember that seqlengths must be set, else it does not know what last base in sequence is before loop ends!

Details

Remember if you have a fasta file of transcripts (transcript coordinates), delete all negative stranded ORFs afterwards by: orfs <- orfs[strandBool(orfs)] # negative strand orfs make no sense then. Seqnames are created from header by format: >name info, so name must be first after "biggern than" and space between name and info. Also make sure your fasta file is valid (no hidden spaces etc), as this might break the coordinate system!

Value

(GRanges) object of ORFs mapped from fasta file. Positions are relative to the fasta file.

See Also

Other findORFs: `findMapORFs()`, `findORFs()`, `findUORFs()`, `startDefinition()`, `stopDefinition()`

Examples

```
# location of the example fasta file
example_genome <- system.file("extdata", "genome.fasta", package = "ORFik")
orfs <- findORFsFasta(example_genome)
# To store ORF sequences (you need indexed genome .fai file):
fa <- FaFile(example_genome)
names(orfs) <- paste0("ORF_", seq.int(length(orfs)), "_", seqnames(orfs))
orf_seqs <- getSeq(fa, orfs)
# You sequences (fa), needs to have isCircular(fa) == TRUE for it to work
# on circular wrapping ranges!

# writeXStringSet(DNAStringSet(orf_seqs), "orfs.fasta")
```

---

findPeaksPerGene *Find peaks per gene*

Description

For finding the peaks (stall sites) per gene, with some default filters. A peak is basically a position of very high coverage compared to its surrounding area, as measured using zscore.

Usage

```
findPeaksPerGene(
  tx,
  reads,
  top_tx = 0.5,
  min_reads_per_tx = 20,
  min_reads_per_peak = 10,
  type = "max"
)
```

Arguments

tx	a GRangesList
reads	a GAlignments or GRanges, must be 1 width reads like p-shifts, or other reads that is single positioned.
top_tx	numeric, default 0.50 (only use 50% top transcripts by read counts).
min_reads_per_tx	numeric, default 20. Gene must have at least 20 reads, applied before type filter.
min_reads_per_peak	numeric, default 10. Peak must have at least 10 reads.
type	character, default "max". Get only max peak per gene. Alternatives: "all", all peaks passing the input filter will be returned. "median", only peaks that is higher than the median of all peaks. "maxmedian": get first "max", then median of those.

Details

For more details see reference, which uses a slightly different method by zscore of a sliding window instead of over the whole tx.

Value

a data.table of gene_id, position, counts of the peak, zscore and standard deviation of the peak compared to rest of gene area.

References

doi: 10.1261/rna.065235.117

Examples

```
df <- ORFik.template.experiment()
cds <- loadRegion(df, "cds")
# Load ribo seq from ORFik
rfp <- fimport(df[3,]$filepath)
# All transcripts passing filter
findPeaksPerGene(cds, rfp, top_tx = 0)
# Top 50% of genes
findPeaksPerGene(cds, rfp)
```

---

findUORFs *Find upstream ORFs from transcript annotation*

Description

Procedure: 1. Create a new search space starting with the 5' UTRs. 2. Redefine TSS with CAGE if wanted. 3. Add the whole of CDS to search space to allow uORFs going into cds. 4. find ORFs on that search space. 5. Filter out wrongly found uORFs, if CDS is included. The CDS, alternative CDS, uORFs starting within the CDS etc.

Usage

```
findUORFs(
  fiveUTRs,
  fa,
  startCodon = startDefinition(1),
  stopCodon = stopDefinition(1),
  longestORF = TRUE,
  minimumLength = 0,
  cds = NULL,
  cage = NULL,
  extension = 1000,
  filterValue = 1,
  restrictUpstreamToTx = FALSE,
  removeUnused = FALSE
)
```

Arguments

fiveUTRs	(GRangesList) The 5' leaders or full transcript sequences
fa	a FaFile. With fasta sequences corresponding to fiveUTR annotation. Usually loaded from the genome of an organism with fa = ORFik:::findFa("path/to/fasta/genome")
startCodon	(character vector) Possible START codons to search for. Check startDefinition for helper function.
stopCodon	(character vector) Possible STOP codons to search for. Check stopDefinition for helper function.
longestORF	(logical) Default TRUE. Keep only the longest ORF per unique stopcodon: (seqname, strand, stopcodon) combination, Note: Not longest per transcript! You can also use function longestORFs after creation of ORFs for same result.
minimumLength	(integer) Default is 0. Which is START + STOP = 6 bp. Minimum length of ORF, without counting 3bps for START and STOP codons. For example minimumLength = 8 will result in size of ORFs to be at least START + 8*3 (bp) + STOP = 30 bases. Use this param to restrict search.
cds	(GRangesList) CDS of relative fiveUTRs, applicable only if you want to extend 5' leaders downstream of CDS's, to allow upstream ORFs that can overlap into CDS's.
cage	Either a filePath for the CageSeq file as .bed .bam or .wig, with possible compressions (".gzip", ".gz", ".bgz"), or already loaded CageSeq peak data as GRanges or GAlignment. NOTE: If it is a .bam file, it will add a score column by running: convertToOneBasedRanges(cage, method = "5prime", addScoreColumn = TRUE) The score column is then number of replicates of read, if score column is something else, like read length, set the score column to NULL first.
extension	The maximum number of basses upstream of the TSS to search for CageSeq peak.
filterValue	The minimum number of reads on cage position, for it to be counted as possible new tss. (represented in score column in CageSeq data) If you already filtered, set it to 0.
restrictUpstreamToTx	a logical (FALSE). If TRUE: restrict leaders to not extend closer than 5 bases from closest upstream leader, set this to TRUE.
removeUnused	logical (FALSE), if False: (standard is to set them to original annotation), If TRUE: remove leaders that did not have any cage support.

Details

From default a filtering process is done to remove "fake" uORFs, but only if cds is included, since uORFs that stop on the stop codon on the CDS is not a uORF, but an alternative cds by definition, etc.

Value

A GRangesList of uORFs, 1 granges list element per uORF.

See Also

Other findORFs: `findMapORFs()`, `findORFsFasta()`, `findORFs()`, `startDefinition()`, `stopDefinition()`

Examples

```
# Load annotation
txdbFile <- system.file("extdata", "hg19_knownGene_sample.sqlite",
                        package = "GenomicFeatures")
## Not run:
 txdb <- loadTxdb(txdbFile)
 fiveUTRs <- loadRegion(txdb, "leaders")
 cds <- loadRegion(txdb, "cds")
 if (requireNamespace("BSgenome.Hsapiens.UCSC.hg19")) {
   # Normally you would not use a BSgenome, but some custom fasta-
   # annotation you  have for your species
   findUORFs(fiveUTRs, BSgenome.Hsapiens.UCSC.hg19::Hsapiens, "ATG",
             cds = cds)
 }

## End(Not run)
```

---

find_url_ebi *Locates and check if fastq files exists in ebi*

Description

Look for files in ebi following url: ftp://ftp.sra.ebi.ac.uk/vol1/fastq Paired end and single end fastq files

Usage

```
find_url_ebi(SRR, stop.on.error = FALSE)
```

Arguments

SRR	character, SRR, ERR or DRR numbers.
stop.on.error	logical FALSE, if true will stop if all files are not found.

Value

full url to fastq files, same length as input (2 urls for paired end data). Returns empty character() if all files not found.

firstEndPerGroup *Get first end per granges group*

Description

grl must be sorted, call ORFik:::sortPerGroup if needed

Usage

```
firstEndPerGroup(grl, keep.names = TRUE)
```

Arguments

grl	a GRangesList
keep.names	a boolean, keep names or not, default: (TRUE)

Value

a Rle(keep.names = T), or integer vector(F)

Examples

```
gr_plus <- GRanges(seqnames = c("chr1", "chr1"),
                   ranges = IRanges(c(7, 14), width = 3),
                   strand = c("+", "+"))
gr_minus <- GRanges(seqnames = c("chr2", "chr2"),
                    ranges = IRanges(c(4, 1), c(9, 3)),
                    strand = c("-", "-"))
grl <- GRangesList(tx1 = gr_plus, tx2 = gr_minus)
firstEndPerGroup(grl)
```

firstExonPerGroup *Get first exon per GRangesList group*

Description

grl must be sorted, call ORFik:::sortPerGroup if needed

Usage

```
firstExonPerGroup(grl)
```

Arguments

grl	a GRangesList

Value

a GRangesList of the first exon per group

Examples

```
gr_plus <- GRanges(seqnames = c("chr1", "chr1"),
                   ranges = IRanges(c(7, 14), width = 3),
                   strand = c("+", "+"))
gr_minus <- GRanges(seqnames = c("chr2", "chr2"),
                    ranges = IRanges(c(4, 1), c(9, 3)),
                    strand = c("-", "-"))
grl <- GRangesList(tx1 = gr_plus, tx2 = gr_minus)
firstExonPerGroup(grl)
```

`firstStartPerGroup` *Get first start per granges group*

Description

grl must be sorted, call ORFik:::sortPerGroup if needed

Usage

```
firstStartPerGroup(grl, keep.names = TRUE)
```

Arguments

`grl`	a GRangesList
`keep.names`	a boolean, keep names or not, default: (TRUE)

Value

a Rle(keep.names = TRUE), or integer vector(FALSE)

Examples

```
gr_plus <- GRanges(seqnames = c("chr1", "chr1"),
                   ranges = IRanges(c(7, 14), width = 3),
                   strand = c("+", "+"))
gr_minus <- GRanges(seqnames = c("chr2", "chr2"),
                    ranges = IRanges(c(4, 1), c(9, 3)),
                    strand = c("-", "-"))
grl <- GRangesList(tx1 = gr_plus, tx2 = gr_minus)
firstStartPerGroup(grl)
```

floss *Fragment Length Organization Similarity Score*

Description

This feature is usually calcualted only for RiboSeq reads. For reads of width between ‘start‘ and ‘end‘, sum the fraction of RiboSeq reads (per read widths) that overlap ORFs and normalize by CDS read width fractions. So if all read length are width 34 in ORFs and CDS, value is 1. If width is 33 in ORFs and 34 in CDS, value is 0. If width is 33 in ORFs and 50/50 (33 and 34) in CDS, values will be 0.5 (for 33).

Usage

```
floss(grl, RFP, cds, start = 26, end = 34, weight = 1L)
```

Arguments

grl	a GRangesList object can be either transcripts, 5’ utrs, cds’, 3’ utrs or ORFs as a special case (uORFs, potential new cds’ etc). If regions are not spliced you can send a GRanges object.
RFP	ribosomal footprints, given as GAlignments or GRanges object, must be already shifted and resized to the p-site. Requires a $size column with original read lengths.
cds	a GRangesList of coding sequences, cds has to have names as grl so that they can be matched
start	usually 26, the start of the floss interval (inclusive)
end	usually 34, the end of the floss interval (inclusive)
weight	a vector (default: 1L, if 1L it is identical to countOverlaps()), if single number (!= 1), it applies for all, if more than one must be equal size of ’reads’. else it must be the string name of a defined meta column in subject "reads", that gives number of times a read was found. GRanges("chr1", 1, "+", score = 5), would mean "score" column tells that this alignment region was found 5 times.

Details

Pseudo explanation of the function:

```
SUM[start to stop]((grl[start:end][name]/grl) / (cds[start:end][name]/cds))
```

Where ’name’ is transcript names.
Please read more in the article.

Value

a vector of FLOSS of length same as grl, 0 means no RFP reads in range, 1 is perfect match.

References

doi: 10.1016/j.celrep.2014.07.045

Examples

```
ORF1 <- GRanges(seqnames = "1",
                ranges = IRanges(start = c(1, 12, 22),
                end = c(10, 20, 32)),
                strand = "+")
grl <- GRangesList(tx1_1 = ORF1)
# RFP is 1 width position based GRanges
RFP <- GRanges("1", IRanges(c(1, 25, 35, 38), width = 1), "+")
RFP$size <- c(28, 28, 28, 29) # original width in size col
cds <-  GRangesList(tx1 = GRanges("1", IRanges(35, 44), "+"))
# grl must have same names as cds + _1 etc, so that they can be matched.
floss(grl, RFP, cds)
# or change ribosome start/stop, more strict
floss(grl, RFP, cds, 28, 28)

# With repeated alignments in score column
ORF2 <- GRanges(seqnames = "1",
                ranges = IRanges(start = c(12, 22, 36),
                end = c(20, 32, 38)),
                strand = "+")
grl <- GRangesList(tx1_1 = ORF1, tx1_2 = ORF2)
score(RFP) <- c(5, 10, 5, 10)
floss(grl, RFP, cds, weight = "score")
```

---

footprints.analysis *Pre shifting plot analysis*

Description

For internal use only!

Usage

```
footprints.analysis(rw, heatmap, region = "start of CDS")
```

Arguments

rw	a data.table of position, score and fraction (read length) of either TIS or TES (translation end site, around 3' UTR)
heatmap	a logical or character string, default FALSE. If TRUE, will plot heatmap of raw reads before p-shifting to console, to see if shifts given make sense. You can also set a filepath to save the file there.
region	a character string, default "start of CDS"

Value

invisible(NULL)

`fpkm` *Create normalizations of overlapping read counts.*

Description

FPKM is short for "Fragments Per Kilobase of transcript per Million fragments in library". When calculating RiboSeq data FPKM over ORFs, use ORFs as 'grl'. When calculating RNASeq data FPKM, use full transcripts as 'grl'. It is equal to RPKM given that you do not have paired end reads.

Usage

```
fpkm(grl, reads, pseudoCount = 0, librarySize = "full", weight = 1L)
```

Arguments

`grl`	a `GRangesList` object can be either transcripts, 5' utrs, cds', 3' utrs or ORFs as a special case (uORFs, potential new cds' etc). If regions are not spliced you can send a `GRanges` object.
`reads`	a `GAlignments`, `GRanges` or `GRangesList` object, usually of RiboSeq, RnaSeq, CageSeq, etc.
`pseudoCount`	an integer, by default is 0, set it to 1 if you want to avoid NA and inf values.
`librarySize`	either numeric value or character vector. Default ("full"), number of alignments in library (reads). If you just have a subset, you can give the value by librarySize = length(wholeLib), if you want lib size to be only number of reads overlapping grl, do: librarySize = "overlapping" sum(countOverlaps(reads, grl) > 0), if reads[1] has 3 hits in grl, and reads[2] has 2 hits, librarySize will be 2, not 5. You can also get the inverse overlap, if you want lib size to be total number of overlaps, do: librarySize = "DESeq" This is standard fpkm way of DESeq2::fpkm(robust = FALSE) sum(countOverlaps(grl, reads)) if grl[1] has 3 reads and grl[2] has 2 reads, librarySize is 5, not 2.
`weight`	a vector (default: 1L, if 1L it is identical to countOverlaps()), if single number (!= 1), it applies for all, if more than one must be equal size of 'reads'. else it must be the string name of a defined meta column in subject "reads", that gives number of times a read was found. GRanges("chr1", 1, "+", score = 5), would mean "score" column tells that this alignment region was found 5 times.

Details

Note also that you must consider if you will use the whole read library or just the reads overlapping 'grl' for library size. A normal question here is, does it make sense to include rRNA in library size ? If you only want overlapping grl, do: librarySize = "overlapping"

Value

a numeric vector with the fpkm values

References

doi: 10.1038/nbt.1621

Examples

```
ORF <- GRanges(seqnames = "1",
               ranges = IRanges(start = c(1, 10, 20),
               end = c(5, 15, 25)),
               strand = "+")
grl <- GRangesList(tx1_1 = ORF)
RFP <- GRanges("1", IRanges(25, 25),"+")
fpkm(grl, RFP)

# With weights (10 reads at position 25)
RFP <- GRanges("1", IRanges(25, 25),"+", score = 10)
fpkm(grl, RFP, weight = "score")
```

---

fpkm_calc *Create normalizations of read counts*

Description

A helper for [fpkm()] Normally use function [fpkm()], if you want unusual normalization , you can use this. Short for: Fragments per kilobase of transcript per million fragments Normally used in Translations efficiency calculations

Usage

```
fpkm_calc(counts, lengthSize, librarySize)
```

Arguments

counts	a list, # of read hits per group
lengthSize	a list of lengths per group
librarySize	a numeric of size 1, the # of reads in library

Value

a numeric vector

References

doi: 10.1038/nbt.1621

See Also

Other features: computeFeaturesCage(), computeFeatures(), countOverlapsW(), disengagementScore(), distToCds(), distToTSS(), entropy(), floss(), fpkm(), fractionLength(), initiationScore(), insideOutsideORF(), isInFrame(), isOverlapping(), kozakSequenceScore(), orfScore(), rankOrder(), ribosomeReleaseScore(), ribosomeStallingScore(), startRegionCoverage(), startRegion(), stopRegion(), subsetCoverage(), translationalEff()

`fractionLength` *Fraction Length*

Description

Fraction Length is defined as

```
(widths of grl)/tx_len
```

so that each group in the grl is divided by the corresponding transcript.

Usage

```
fractionLength(grl, tx_len)
```

Arguments

grl	a GRangesList object with usually either leaders, cds', 3' utrs or ORFs. ORFs are a special case, see argument tx_len
tx_len	the transcript lengths of the transcripts, a named (tx names) vector of integers. If you have the transcripts as GRangesList, call 'ORFik:::widthPerGroup(tx, TRUE)'. If you used CageSeq to reannotate leaders, then the tss for the the leaders have changed, therefore the tx lengths have changed. To account for that call: 'tx_len <- widthPerGroup(extendLeaders(tx, cageFiveUTRs))' and calculate fraction length using 'fractionLength(grl, tx_len)'.

Value

a numeric vector of ratios

References

doi: 10.1242/dev.098343

```
ORF <- GRanges(seqnames = "1",
               ranges = IRanges(start = c(1, 10, 20), end = c(5, 15, 25)),
               strand = "+")
grl <- GRangesList(tx1_1 = ORF)
# grl must have same names as cds + _1 etc, so that they can be matched.
tx <-  GRangesList(tx1 = GRanges("1", IRanges(1, 50), "+"))
fractionLength(grl, ORFik:::widthPerGroup(tx, keep.names = TRUE))
```

---

fread.bed *Load bed file as GRanges*

Description

Wraps around import.bed and tries to speed up loading with the use of data.table. Supports gzip, gz, bgz and bed formats. Also safer chromosome naming with the argument chrStyle

Usage

```
fread.bed(filePath, chrStyle = NULL)
```

Arguments

filePath	The location of the bed file
chrStyle	a GRanges object, TxDb, FaFile, or a seqlevelsStyle (Default: NULL) to get seqlevelsStyle from. Is chromosome 1 called chr1 or 1, is mitocondrial chromosome called MT or chrM etc. Will use 1st seqlevel-style if more are present. Like: c("NCBI", "UCSC") -> pick "NCBI"

Value

a GRanges object

See Also

Other utils: bedToGR(), convertToOneBasedRanges(), export.bed12(), export.wiggle(), fimport(), findFa(), optimizeReads(), readBam(), readWig()

Examples

```
# path to example CageSeq data from hg19 heart sample
cageData <- system.file("extdata", "cage-seq-heart.bed.bgz",
                        package = "ORFik")
fread.bed(cageData)
```

gcContent *Get GC content*

Description

0.5 means 50

Usage

```
gcContent(seqs, fa = NULL)
```

Arguments

seqs	a character vector of sequences, or ranges as GRangesList
fa	fasta index file .fai file, either path to it, or the loaded FaFile, default (NULL), only set if you give ranges as GRangesList

Value

a numeric vector of gc content scores

Examples

```
# Here we make an example from scratch
seqName <- "Chromosome"
ORF1 <- GRanges(seqnames = seqName,
                   ranges = IRanges(c(1007, 1096), width = 60),
                   strand = c("+", "+"))
ORF2 <- GRanges(seqnames = seqName,
                    ranges = IRanges(c(400, 100), width = 30),
                    strand = c("-", "-"))
ORFs <- GRangesList(tx1 = ORF1, tx2 = ORF2)
# get path to FaFile for sequences
faFile <- system.file("extdata", "genome.fasta", package = "ORFik")
gcContent(ORFs, faFile)
```

getGAlignments *Internal GAlignments loader from fst data.frame*

Description

Internal GAlignments loader from fst data.frame

Usage

```
getGAlignments(df)
```

Arguments

df	a data.frame with columns minimum 4 columns: seqnames, start ("pos" in final GA object), strand and width. Additional columns will be assigned as meta columns

Value

GAlignments object

`getGAlignmentsPairs` *Internal GAlignmentPairs loader from fst data.frame*

Description

Internal GAlignmentPairs loader from fst data.frame

Usage

```
getGAlignmentsPairs(df, strandMode = 0)
```

Arguments

`df`	a data.frame with columns minimum 6 columns: seqnames, start1/start2 (integers), cigar1/cigar2 and strand Additional columns will be assigned as meta columns
`strandMode`	numeric, default 0. Only used for paired end bam files. One of (0: strand = *, 1: first read of pair is +, 2: first read of pair is -). See ?strandMode. Note: Sets default to 0 instead of 1, as readGAlignmentPairs uses 1. This is to guarantee hits, but will also make mismatches of overlapping transcripts in opposite directions.

Value

GAlignmentPairs object

`getGenomeAndAnnotation` *Download genome (fasta), annotation (GTF) and contaminants*

Description

This function automatically downloads (if files not already exists) genomes and contaminants specified for genome alignment. Will create a R transcript database (TxDb object) from the annotation. It will also index the genome for you
If you misspelled something or crashed, delete wrong files and run again.
Do remake = TRUE, to do it all over again.

Usage

```
getGenomeAndAnnotation(
  organism,
  output.dir,
  db = "ensembl",
  GTF = TRUE,
  genome = TRUE,
  merge_contaminants = TRUE,
  phix = FALSE,
  ncRNA = FALSE,
  tRNA = FALSE,
  rRNA = FALSE,
  gunzip = TRUE,
  remake = FALSE,
  assembly_type = "primary_assembly"
)
```

Arguments

organism	scientific name of organism, Homo sapiens, Danio rerio, Mus musculus, etc. See `biomartr:::get.ensembl.info()` for full list of supported organisms.
output.dir	directory to save downloaded data
db	database to use for genome and GTF, default adviced: "ensembl" (will contain haplotypes, large file!). Alternatives: "refseq" (primary assembly) and "genbank" (mix)
GTF	logical, default: TRUE, download gtf of organism specified in "organism" argument. If FALSE, check if the downloaded file already exist. If you want to use a custom gtf from you hard drive, set GTF = FALSE, and assign: annotation <- getGenomeAndAnnotation(gtf = FALSE) annotation["gtf"] = "path/to/gtf.gtf". Only db = "ensembl" allowed for GTF.
genome	logical, default: TRUE, download genome of organism specified in "organism" argument. If FALSE, check if the downloaded file already exist. If you want to use a custom gtf from you hard drive, set GTF = FALSE, and assign: annotation <- getGenomeAndAnnotation(genome = FALSE) annotation["genome"] = "path/to/genome.fasta". Will download the primary assembly for ensembl
merge_contaminants	logical, default TRUE. Will merge the contaminants specified into one fasta file, this considerably saves space and is much quicker to align with STAR than each contamint on it's own. If no contaminants are specified, this is ignored.
phix	logical, default FALSE, download phix sequence to filter out with. Phix is used as a contaminant genome. Only use if illumina sequencing. Phix is used in Illumina sequencers for sequencing quality control. Genome is: refseq, Escherichia virus phiX174
ncRNA	logical or character, default FALSE (not used, no download), ncRNA is used as a contaminant genome. If TRUE, will try to find ncRNA sequences from the gtf file, usually represented as lncRNA (long noncoding RNA's). Will let you know if no ncRNA sequences were found in gtf. If not found try character input:

Alternatives: "auto" or manual assign like "human". If "auto" will try to find ncRNA file on NONCODE from organism, Homo sapiens -> human etc. "auto" will not work for all, then you must specify the name used by NONCODE, go to the link below and find it. If not "auto" / "" it must be a character vector of species common name (not scientific name) Homo sapiens is human, Rattus norwegicus is rat etc, download ncRNA sequence to filter out with. From NONCODE online server, if you cant find common name see: http://www.noncode.org/download.php/

`tRNA` logical or character, default FALSE (not used, no download), tRNA is used as a contaminant genome. If TRUE, will try to find tRNA sequences from the gtf file, usually represented as Mt_tRNA (mature tRNA's). Will let you know if no tRNA sequences were found in gtf. If not found try character input:
if not "" it must be a character vector to valid path of mature tRNAs fasta file to remove as contaminants on your disc. Find and download your wanted mtRNA at: http://gtrnadb.ucsc.edu/, or run trna-scan on you genome.

`rRNA` logical or character, default FALSE (not used, no download), rRNA is used as a contaminant genome. If TRUE, will try to find rRNA sequences from the gtf file, usually represented as rRNA (ribosomal RNA's). Will let you know if no rRNA sequences were found in gtf. If not found you can try character input:
If "silva" will download silva SSU & LSU sequences for all species (250MB file) and use that. If you want a smaller file go to https://www.arb-silva.de/
If not "" or "silva" it must be a character vector to valid path of mature rRNA fasta file to remove as contaminants on your disc.

`gunzip` logical, default TRUE, uncompress downloaded files that are zipped when downloaded, should be TRUE!

`remake` logical, default: FALSE, if TRUE remake everything specified

`assembly_type` a character string specifying from which assembly type the genome shall be retrieved from (ensembl only, else this argument is ignored): Default is `assembly_type = "primary_assembly")`. This will give you all no copies of any chromosomes. As an example, the primary_assembly fasta genome in human is only a few GB uncompressed.
`assembly_type = "toplevel")`. This will give you all multi-chromosomes (copies of the same chromosome with small variations). As an example the toplevel fasta genome in human is over 70 GB uncompressed. To get primary assembly with 1 chromosome variant per chromosome:

Details

If you want custom genome or gtf from you hard drive, assign it after you run this function, like this:
annotation <- getGenomeAndAnnotation(GTF = FALSE, genome = FALSE)
annotation["genome"] = "path/to/genome.fasta"
annotation["gtf"] = "path/to/gtf.gtf"

Value

a named character vector of path to genomes and gtf downloaded, and additional contaminants if used. If merge_contaminants is TRUE, will not give individual fasta files to contaminants, but only the merged one.

See Also

Other STAR: STAR.align.folder(), STAR.align.single(), STAR.allsteps.multiQC(), STAR.index(), STAR.install(), STAR.multiQC(), STAR.remove.crashed.genome(), install.fastp()

Examples

```
output.dir <- "/Bio_data/references/zebrafish"
#getGenomeAndAnnotation("Danio rerio", output.dir)

## Get Phix contamints to deplete during alignment
#getGenomeAndAnnotation("Danio rerio", output.dir, phix = TRUE)
```

---

getGRanges *Internal GRanges loader from fst data.frame*

Description

Internal GRanges loader from fst data.frame

Usage

```
getGRanges(df)
```

Arguments

df	a data.frame with columns minimum 4 columns: seqnames, start, strand and width. Additional columns will be assigned as meta columns

Value

GRanges object

---

getNGenesCoverage *Get number of genes per coverage table*

Description

Used to count genes in ORFik meta plots

Usage

```
getNGenesCoverage(coverage)
```

Arguments

coverage	a data.table with coverage

Value

number of genes in coverage

getWeights *Get weights from a subject GenomicRanges object*

Description

Get weights from a subject GenomicRanges object

Usage

```
getWeights(subject, weight = 1L)
```

Arguments

subject	a GRanges, IRanges or GAlignment object
weight	a vector (default: 1L, if 1L it is identical to countOverlaps()), if single number (!= 1), it applies for all, if more than one must be equal size of 'reads'. else it must be the string name of a defined meta column in subject "reads", that gives number of times a read was found. GRanges("chr1", 1, "+", score = 5), would mean "score" column tells that this alignment region was found 5 times.

Value

a numeric vector of weights of equal size to subject

get_genome_fasta *Download genome (fasta), annotation (GTF) and contaminants*

Description

This function automatically downloads (if files not already exists) genomes and contaminants specified for genome alignment. Will create a R transcript database (TxDb object) from the annotation. It will also index the genome for you
If you misspelled something or crashed, delete wrong files and run again.
Do remake = TRUE, to do it all over again.

Usage

```
get_genome_fasta(genome, output.dir, organism, assembly_type, db, gunzip)
```

Arguments

genome	logical, default: TRUE, download genome of organism specified in "organism" argument. If FALSE, check if the downloaded file already exist. If you want to use a custom gtf from you hard drive, set GTF = FALSE, and assign: annotation <- getGenomeAndAnnotation(genome = FALSE) annotation["genome"] = "path/to/genome.fasta". Will download the primary assembly for ensembl
output.dir	directory to save downloaded data

organism	scientific name of organism, Homo sapiens, Danio rerio, Mus musculus, etc. See biomartr:::get.ensembl.info() for full list of supported organisms.
assembly_type	a character string specifying from which assembly type the genome shall be retrieved from (ensembl only, else this argument is ignored): Default is assembly_type = "primary_assembly"). This will give you all no copies of any chromosomes. As an example, the primary_assembly fasta genome in human is only a few GB uncompressed. assembly_type = "toplevel"). This will give you all multi-chromosomes (copies of the same chromosome with small variations). As an example the toplevel fasta genome in human is over 70 GB uncompressed. To get primary assembly with 1 chromosome variant per chromosome:
db	database to use for genome and GTF, default adviced: "ensembl" (will contain haplotypes, large file!). Alternatives: "refseq" (primary assembly) and "genbank" (mix)
gunzip	logical, default TRUE, uncompress downloaded files that are zipped when downloaded, should be TRUE!

Details

If you want custom genome or gtf from you hard drive, assign it after you run this function, like this:
annotation <- getGenomeAndAnnotation(GTF = FALSE, genome = FALSE)
annotation["genome"] = "path/to/genome.fasta"
annotation["gtf"] = "path/to/gtf.gtf"

Value

a named character vector of path to genomes and gtf downloaded, and additional contaminants if used. If merge_contaminants is TRUE, will not give individual fasta files to contaminants, but only the merged one.

```

---

get_genome_gtf *Download genome (fasta), annotation (GTF) and contaminants*

Description

This function automatically downloads (if files not already exists) genomes and contaminants specified for genome alignment. Will create a R transcript database (TxDb object) from the annotation. It will also index the genome for you
If you misspelled something or crashed, delete wrong files and run again.
Do remake = TRUE, to do it all over again.

Usage

```
get_genome_gtf(GTF, output.dir, organism, assembly_type, gunzip, genome)
```

Arguments

GTF	logical, default: TRUE, download gtf of organism specified in "organism" argument. If FALSE, check if the downloaded file already exist. If you want to use a custom gtf from you hard drive, set GTF = FALSE, and assign: annotation <- getGenomeAndAnnotation(gtf = FALSE) annotation["gtf"] = "path/to/gtf.gtf". Only db = "ensembl" allowed for GTF.
output.dir	directory to save downloaded data
organism	scientific name of organism, Homo sapiens, Danio rerio, Mus musculus, etc. See `biomartr:::get.ensembl.info()` for full list of supported organisms.
assembly_type	a character string specifying from which assembly type the genome shall be retrieved from (ensembl only, else this argument is ignored): Default is `assembly_type = "primary_assembly"`). This will give you all no copies of any chromosomes. As an example, the primary_assembly fasta genome in human is only a few GB uncompressed. `assembly_type = "toplevel"`). This will give you all multi-chromosomes (copies of the same chromosome with small variations). As an example the toplevel fasta genome in human is over 70 GB uncompressed. To get primary assembly with 1 chromosome variant per chromosome:
gunzip	logical, default TRUE, uncompress downloaded files that are zipped when downloaded, should be TRUE!
genome	a character path, default NULL. if set, must be path to genome fasta file, must be indexed. If you want to make sure chromosome naming of the GTF matches the genome. Not necessary if you downloaded from same source. If value is NULL or FALSE, will be ignored.

Details

If you want custom genome or gtf from you hard drive, assign it after you run this function, like this:
annotation <- getGenomeAndAnnotation(GTF = FALSE, genome = FALSE)
annotation["genome"] = "path/to/genome.fasta"
annotation["gtf"] = "path/to/gtf.gtf"

Value

a named character vector of path to genomes and gtf downloaded, and additional contaminants if used. If merge_contaminants is TRUE, will not give individual fasta files to contaminants, but only the merged one.

#getGenomeAndAnnotation("Danio rerio", output.dir)

## Get Phix contamints to deplete during alignment
#getGenomeAndAnnotation("Danio rerio", output.dir, phix = TRUE)
```

---

get_noncoding_rna *Download genome (fasta), annotation (GTF) and contaminants*

Description

This function automatically downloads (if files not already exists) genomes and contaminants specified for genome alignment. Will create a R transcript database (TxDb object) from the annotation. It will also index the genome for you
If you misspelled something or crashed, delete wrong files and run again.
Do remake = TRUE, to do it all over again.

Usage

```
get_noncoding_rna(ncRNA, output.dir, organism, gunzip)
```

Arguments

ncRNA	logical or character, default FALSE (not used, no download), ncRNA is used as a contaminant genome. If TRUE, will try to find ncRNA sequences from the gtf file, usually represented as lncRNA (long noncoding RNA's). Will let you know if no ncRNA sequences were found in gtf. If not found try character input: Alternatives: "auto" or manual assign like "human". If "auto" will try to find ncRNA file on NONCODE from organism, Homo sapiens -> human etc. "auto" will not work for all, then you must specify the name used by NONCODE, go to the link below and find it. If not "auto" / "" it must be a character vector of species common name (not scientific name) Homo sapiens is human, Rattus norwegicus is rat etc, download ncRNA sequence to filter out with. #getGenomeAndAnnotation("Danio rerio", output.dir, phix = TRUE)
```

`get_phix_genome` *Download genome (fasta), annotation (GTF) and contaminants*

Description

This function automatically downloads (if files not already exists) genomes and contaminants specified for genome alignment. Will create a R transcript database (TxDb object) from the annotation. It will also index the genome for you
If you misspelled something or crashed, delete wrong files and run again.
Do remake = TRUE, to do it all over again.

Usage

```
get_phix_genome(phix, output.dir, gunzip)
```

Arguments

`phix`	logical, default FALSE, download phix sequence to filter out with. Phix is used as a contaminant genome. Only use if illumina sequencing. Phix is used in Illumina sequencers for sequencing quality control. Genome is: refseq, Escherichia virus phiX174
`output.dir`	directory to save downloaded data
`gunzip`	logical, default TRUE, uncompress downloaded files that are zipped when downloaded, should be TRUE!

Details

If you want custom genome or gtf from you hard drive, assign it after you run this function, like this:
annotation <- getGenomeAndAnnotation(GTF = FALSE, genome = FALSE)
annotation["genome"] = "path/to/genome.fasta"
annotation["gtf"] = "path/to/gtf.gtf"

## Get Phix contamints to deplete during alignment
#getGenomeAndAnnotation("Danio rerio", output.dir, phix = TRUE)
```

---

get_silva_rRNA *Download Silva SSU & LSU sequences*

Description

Version downloaded is 138.1. NR99_tax (non redundant)

Usage

```
get_silva_rRNA(output.dir)
```

Arguments

`output.dir`	directory to save downloaded data

Details

If it fails from timeout, set higher timeout: options(timeout = 200)

Value

filepath to downloaded file

Examples

```
output.dir <- tempdir()
# get_silva_rRNA(output.dir)
```

groupGRangesBy *Group GRanges*

Description

It will group / split the GRanges object by the argument 'other'. For example if you would like to to group GRanges object by gene, set other to gene names.
If 'other' is not specified function will try to use the names of the GRanges object. It will then be similar to 'split(gr, names(gr))'.

Usage

```
groupGRangesBy(gr, other = NULL)
```

Arguments

gr	a GRanges object
other	a vector of unique names to group by (default: NULL)

Details

It is important that all intended groups in 'other' are uniquely named, otherwise duplicated group names will be grouped together.

Value

a GRangesList named after names(Granges) if other is NULL, else names are from unique(other)

Examples

```
ORFranges <- GRanges(seqnames = Rle(rep("1", 3)),
                     ranges = IRanges(start = c(1, 10, 20),
                                      end = c(5, 15, 25)),
                     strand = "+")
ORFranges2 <- GRanges("1",
                      ranges = IRanges(start = c(20, 30, 40),
                                       end = c(25, 35, 45)),
                      strand = "+")
names(ORFranges) = rep("tx1_1", 3)
names(ORFranges2) = rep("tx1_2", 3)
grl <- GRangesList(tx1_1 = ORFranges, tx1_2 = ORFranges2)
gr <- unlist(grl, use.names = FALSE)
## now recreate the grl
## group by orf
grltest <- groupGRangesBy(gr) # using the names to group
identical(grl, grltest) ## they are identical

## group by transcript
names(gr) <- txNames(gr)
grltest <- groupGRangesBy(gr)
identical(grl, grltest) ## they are not identical
```

groupings *Get number of ranges per group as an iteration*

Description

Get number of ranges per group as an iteration

Usage

```
groupings(grl)
```

Arguments

grl	GRangesList

Value

an integer vector

Examples

```
grl <- GRangesList(GRanges("1", c(1, 3, 5), "+"),
                   GRanges("1", c(19, 21, 23), "+"))
ORFik:::groupings(grl)
```

gSort *Sort a GRangesList, helper.*

Description

A helper for [sortPerGroup()]. A faster, more versatile reimplementation of GenomicRanges::sort() Normally not used directly. Groups first each group, then either decreasing or increasing (on starts if byStarts == T, on ends if byStarts == F)

Usage

```
gSort(grl, decreasing = FALSE, byStarts = TRUE)
```

Arguments

grl	a GRangesList
decreasing	should the first in each group have max(start(group)) ->T or min-> default(F) ?
byStarts	a logical T, should it order by starts or ends F.

Value

an equally named GRangesList, where each group is sorted within group.

hasHits *Hits from reads*

Description

Finding GRanges groups that have overlap hits with reads Similar to

Usage

```
hasHits(grl, reads, keep.names = FALSE, overlaps = NULL)
```

Arguments

grl	a GRangesList or GRanges object
reads	a GRanges, GAlignment or GAlignmentPairs object
keep.names	logical (F), keep names or not
overlaps	default NULL, if not null must be countOverlaps(grl, reads), input if you have it already.

Value

a list of logicals, T == hit, F == no hit

heatMapL *Coverage heatmap of multiple libraries*

Description

Coverage heatmap of multiple libraries

Usage

```
heatMapL(
  region,
  tx,
  df,
  outdir,
  scores = "sum",
  upstream,
  downstream,
  zeroPosition = upstream,
  acceptedLengths = NULL,
  type = "ofst",
  legendPos = "right",
  colors = "default",
  addFracPlot = TRUE,
  location = "TIS",
  shifting = NULL,
  skip.last = FALSE,
```

```
  format = ".png",
  plot.together = TRUE,
  title = TRUE
)
```

Arguments

region	#' a GRangesList object of region, usually either leaders, cds', 3' utrs or ORFs, start region, stop regions etc. This is the region that will be mapped in heatmap
tx	default NULL, a GRangesList of transcripts or (container region), names of tx must contain all grl names. The names of grl can also be the ORFik orf names. that is "txName_id"
df	an ORFik experiment
outdir	a character path to directory to save plot, will be named from ORFik experiment columns
scores	character vector, default c("transcriptNormalized", "sum"), either of zscore, transcriptNormalized, sum, mean, median, .. see ?coverageScorings for info and more alternatives.
upstream	1 or 2 integers, default c(50, 30), how long upstream from 0 should window extend (first index is 5' end extension, second is 3' end extension). If only 1 shifting, only 1 value should be given, if two are given will use first.
downstream	1 or 2 integers, default c(29, 69), how long upstream from 0 should window extend (first index is 5' end extension, second is 3' end extension). If only 1 shifting, only 1 value should be given, if two are given will use first.
zeroPosition	an integer DEFAULT (upstream), what is the center point? Like leaders and cds combination, then 0 is the TIS and -1 is last base in leader. NOTE!: if windows have different widths, this will be ignored.
acceptedLengths	an integer vector (NULL), the read lengths accepted. Default NULL, means all lengths accepted.
type	character, default: "ofst". Type of library: either "default", usually bam format (the one you gave to experiment), "pshifted" pshifted reads, "ofst", "bed", "bedo" optimized bed, or "wig"
legendPos	a character, Default "right". Where should the fill legend be ? ("top", "bottom", "right", "left")
colors	character vector, default: "default", this gives you: c("white", "yellow2", "yellow3", "lightblue", "blue", "navy"), do "high" for more high contrasts, or specify your own colors.
addFracPlot	Add margin histogram plot on top of heatmap with fractions per positions
location	a character, default "start site", will make xlabel of heatmap be Position relative to "start site" or alternative given.
shifting	a character, default c("5prime", "3prime"), can also be either or NULL (no shifting of reads)
skip.last	skip top(highest) read length, default FALSE
format	a character, default ".png", alternative ".pdf"
plot.together	logical (default: FALSE), plot all in 1 plot (if TRUE)
title	a character, default NULL (no title), what is the top title of plot?

Value

invisible(NULL), plots are saved

See Also

Other heatmaps: `coverageHeatMap()`, `heatMapRegion()`, `heatMap_single()`

`heatMapRegion` *Create coverage heatmaps of specified region*

Description

Simplified input space for easier abstraction of coverage heatmaps
Pick your region and plot
Input CAGE file if you use TSS and want improved 5' annotation.

Usage

```
heatMapRegion(
  df,
  region = "TIS",
  outdir = "default",
  scores = c("transcriptNormalized", "sum"),
  type = "ofst",
  cage = NULL,
  format = ".png",
  acceptedLengths = 21:75,
  upstream = c(50, 30),
  downstream = c(29, 69),
  shifting = c("5prime", "3prime")
)
```

Arguments

`df`	an ORFik `experiment`
`region`	a character, default "TIS", can be any combination of the set: c("TSS", "TIS", "TTS"), which are: Transcription start site (5' end of mrna), Translation initation site (5' end of CDS), Translation termination site (3' end of CDS)
`outdir`	a character path, default: "default", saves to: `paste0(dirname(df$filepath[1]),"/QC_STATS/hea` a created folder within the ORFik experiment data folder for plots. Change if you want custom location.
`scores`	character vector, default c("transcriptNormalized", "sum"), either of zscore, transcriptNormalized, sum, mean, median, .. see ?coverageScorings for info and more alternatives.
`type`	character, default: "ofst". Type of library: either "default", usually bam format (the one you gave to experiment), "pshifted" pshifted reads, "ofst", "bed", "bedo" optimized bed, or "wig"
`cage`	a character path to library file or a `GRanges`, `GAlignments` preloaded file of CAGE data. Only used if "TSS" is defined as region, to redefine 5' leaders.

format	a character, default ".png", alternative ".pdf"
acceptedLengths	an integer vector (NULL), the read lengths accepted. Default NULL, means all lengths accepted.
upstream	1 or 2 integers, default c(50, 30), how long upstream from 0 should window extend (first index is 5' end extension, second is 3' end extension). If only 1 shifting, only 1 value should be given, if two are given will use first.
downstream	1 or 2 integers, default c(29, 69), how long upstream from 0 should window extend (first index is 5' end extension, second is 3' end extension). If only 1 shifting, only 1 value should be given, if two are given will use first.
shifting	a character, default c("5prime", "3prime"), can also be either or NULL (no shifting of reads)

Value

invisible(NULL), plots are saved

See Also

Other heatmaps: `coverageHeatMap()`, `heatMapL()`, `heatMap_single()`

Examples

```
# Toy example, will not give logical output, but shows how it works
df <- ORFik.template.experiment()[3,] # Only third library
#heatMapRegion(df, "TIS", outdir = "default")
#
# Do also TSS, add cage for specific TSS
# heatMapRegion(df, c("TSS", "TIS"), cage = "path/to/cage.bed")

# Do on pshifted reads instead of original files
remove.experiments(df) # Remove loaded experiment first
# heatMapRegion(df, "TIS", type = "pshifted")
```

---

heatMap_single *Coverage heatmap of single libraries*

Description

Coverage heatmap of single libraries

Usage

```
heatMap_single(
  region,
  tx,
  reads,
  outdir,
  scores = "sum",
  upstream,
  downstream,
```

```
  zeroPosition = upstream,
  returnCoverage = FALSE,
  acceptedLengths = NULL,
  legendPos = "right",
  colors = "default",
  addFracPlot = TRUE,
  location = "start site",
  shifting = NULL,
  skip.last = FALSE,
  title = NULL
)
```

Arguments

region	#' a GRangesList object of region, usually either leaders, cds', 3' utrs or ORFs, start region, stop regions etc. This is the region that will be mapped in heatmap
tx	default NULL, a GRangesList of transcripts or (container region), names of tx must contain all grl names. The names of grl can also be the ORFik orf names. that is "txName_id"
reads	a GAlignments or GRanges object of RiboSeq, RnaSeq etc. Weigths for scoring is default the 'score' column in 'reads'
outdir	a character path to save file as: not just directory, but full name.
scores	character vector, default "sum", either of zscore, transcriptNormalized, sum, mean, median, .. see ?coverageScorings for info and more alternatives.
upstream	an integer, relative region to get upstream from.
downstream	an integer, relative region to get downstream from
zeroPosition	an integer DEFAULT (upstream), what is the center point? Like leaders and cds combination, then 0 is the TIS and -1 is last base in leader. NOTE!: if windows have different widths, this will be ignored.
returnCoverage	logical, default: FALSE, return coverage, if FALSE returns plot instead.
acceptedLengths	an integer vector (NULL), the read lengths accepted. Default NULL, means all lengths accepted.
legendPos	a character, Default "right". Where should the fill legend be ? ("top", "bottom", "right", "left")
colors	character vector, default: "default", this gives you: c("white", "yellow2", "yellow3", "lightblue", "blue", "navy"), do "high" for more high contrasts, or specify your own colors.
addFracPlot	Add margin histogram plot on top of heatmap with fractions per positions
location	a character, default "start site", will make xlabel of heatmap be Position relative to "start site" or alternative given.
shifting	a character, default NULL (no shifting), can also be either of c("5prime", "3prime")
skip.last	skip top(highest) read length, default FALSE
title	a character, default NULL (no title), what is the top title of plot?

Value

ggplot2 grob (default), data.table (if returnCoverage is TRUE)

See Also

Other heatmaps: `coverageHeatMap()`, `heatMapL()`, `heatMapRegion()`

`import.bedo` *Load GRanges object from .bedo*

Description

.bedo is .bed ORFik, an optimized bed format for coverage reads with read lengths .bedo is a text based format with columns (6 maximum):
1. chromosome
2. start
3. end
4. strand
5. ref width (cigar # M's, match/mismatch total)
6. duplicates of that read

Usage

```
import.bedo(path)
```

Arguments

`path`	a character, location on disc (full path)

Details

Positions are 1-based, not 0-based as .bed. export with export.bedo

Value

GRanges object

`import.bedoc` *Load GAlignments object from .bedoc*

Description

A much faster way to store, load and use bam files.
.bedoc is .bed ORFik, an optimized bed format for coverage reads with cigar and replicate number.
.bedoc is a text based format with columns (5 maximum):
1. chromosome
2. cigar: (cigar # M's, match/mismatch total)
3. start (left most position)
4. strand (+, -, *)
5. score: duplicates of that read

Usage

```
import.bedoc(path)
```

Arguments

path	a character, location on disc (full path)

Details

Positions are 1-based, not 0-based as .bed. export with export.bedo

Value

GAlignments object

---

import.ofst *Load GRanges / GAlignments object from .ofst*

Description

A much faster way to store, load and use bam files.
.ofst is ORFik fast serialized object, an optimized format for coverage reads with cigar and replicate number. It uses the fst format as back-end: fst-package.
A .ofst ribo seq file can compress the information in a bam file from 5GB down to a few MB. This new files has super fast reading time, only a few seconds, instead of minutes. It also has random index access possibility of the file.
.ofst is represented as a data.frane format with minimum 4 columns:
1. chromosome
2. start (left most position)
3. strand (+, -, *)
4. width (not added if cigar exists)
5. cigar (not needed if width exists): (cigar # M's, match/mismatch total)
5. score: duplicates of that read
6. size: qwidth according to reference of read

If file is from GAlignmentPairs, it will contain a cigar1, cigar2 instead of cigar and start1 and start2 instead of start

Usage

```
import.ofst(file, strandMode = 0)
```

Arguments

file	a path to a .ofst file
strandMode	numeric, default 0. Only used for paired end bam files. One of (0: strand = *, 1: first read of pair is +, 2: first read of pair is -). See ?strandMode. Note: Sets default to 0 instead of 1, as readGAlignmentPairs uses 1. This is to guarantee hits, but will also make mismatches of overlapping transcripts in opposite directions.

Details

Other columns can be named whatever you want and added to meta columns. Positions are 1-based, not 0-based as .bed. Import with import.ofst

Value

a GAlignment, GAlignmentPairs or GRanges object, dependent of if cigar/cigar1 is defined in .ofst file.

Examples

```
## GRanges
gr <- GRanges("1:1-3:-")
tmp <- file.path(tempdir(), "path.ofst")
# export.ofst(gr, file = tmp)
# import.ofst(tmp)
## GAlignment
# Make input data.frame
df <- data.frame(seqnames = "1", cigar = "3M", start = 1L, strand = "+")
ga <- ORFik:::getGAlignments(df)
# export.ofst(ga, file = tmp)
# import.ofst(tmp)
```

---

importGtfFromTxdb *Import the GTF / GFF that made the txdb*

Description

Import the GTF / GFF that made the txdb

Usage

```
importGtfFromTxdb(txdb)
```

Arguments

txdb	a TxDb, path to txdb / gff or ORFik experiment object

Value

data.frame, the gtf/gff object imported with rtracklayer::import

initiationScore *Get initiation score for a GRangesList of ORFs*

Description

initiationScore tries to check how much each TIS region resembles, the average of the CDS TIS regions.

Usage

```
initiationScore(grl, cds, tx, reads, pShifted = TRUE, weight = "score")
```

Arguments

grl	a GRangesList object with ORFs
cds	a GRangesList object with coding sequences
tx	a GrangesList of transcripts covering grl.
reads	ribo seq reads as GAlignments, GRanges or GRangesList object
pShifted	a logical (TRUE), are riboseq reads p-shifted?
weight	a vector (default: 1L, if 1L it is identical to countOverlaps()), if single number (!= 1), it applies for all, if more than one must be equal size of 'reads'. else it must be the string name of a defined meta column in subject "reads", that gives number of times a read was found. GRanges("chr1", 1, "+", score = 5), would mean "score" column tells that this alignment region was found 5 times.

Details

Since this features uses a distance matrix for scoring, values are distributed like this: As result there is one value per ORF: 0.000: means that ORF had no reads -1.000: means that ORF is identical to average of CDS 1.000: means that orf is maximum different than average of CDS

If a score column is defined, it will use it as weights, see getWeights

Value

an integer vector, 1 score per ORF, with names of grl

References

doi: 10.1186/s12915-017-0416-0

See Also

Other features: computeFeaturesCage(), computeFeatures(), countOverlapsW(), disengagementScore(), distToCds(), distToTSS(), entropy(), floss(), fpkm_calc(), fpkm(), fractionLength(), insideOutsideORF(), isInFrame(), isOverlapping(), kozakSequenceScore(), orfScore(), rankOrder(), ribosomeReleaseScore(), ribosomeStallingScore(), startRegionCoverage(), startRegion(), stopRegion(), subsetCoverage(), translationalEff()

Examples

```
# Good hiting ORF
ORF <- GRanges(seqnames = "1",
               ranges = IRanges(21, 40),
               strand = "+")
names(ORF) <- c("tx1")
grl <- GRangesList(tx1 = ORF)
# 1 width p-shifted reads
reads <- GRanges("1", IRanges(c(21, 23, 50, 50, 50, 53, 53, 56, 59),
                              width = 1), "+")
score(reads) <- 28 # original width
cds <- GRanges(seqnames = "1",
               ranges = IRanges(50, 80),
               strand = "+")
cds <- GRangesList(tx1 = cds)
tx <- GRanges(seqnames = "1",
               ranges = IRanges(1, 85),
               strand = "+")
tx <- GRangesList(tx1 = tx)

initiationScore(grl, cds, tx, reads, pShifted = TRUE)
```

`insideOutsideORF` *Inside/Outside score (IO)*

Description

Inside/Outside score is defined as

`(reads over ORF)/(reads outside ORF and within transcript)`

A pseudo-count of one is added to both the ORF and outside sums.

Usage

```
insideOutsideORF(
  grl,
  RFP,
  GtfOrTx,
  ds = NULL,
  RFP.sorted = FALSE,
  weight = 1L,
  overlapGrl = NULL
)
```

Arguments

`grl`	a `GRangesList` object with usually either leaders, cds', 3' utrs or ORFs.
`RFP`	RiboSeq reads as GAlignments, GRanges or GRangesList object
`GtfOrTx`	If it is `TxDb` object transcripts will be extracted using `exonsBy(Gtf,by = "tx",use.names = TRUE)`. Else it must be `GRangesList`

ds	numeric vector (NULL), disengagement score. If you have already calculated disengagementScore, input here to save time.
RFP.sorted	logical (FALSE), an optimizer, have you ran this line: RFP <-sort(RFP[countOverlaps(RFP,tx,ty = "within") > 0]) Normally not touched, for internal optimization purposes.
weight	a vector (default: 1L, if 1L it is identical to countOverlaps()), if single number (!= 1), it applies for all, if more than one must be equal size of 'reads'. else it must be the string name of a defined meta column in subject "reads", that gives number of times a read was found. GRanges("chr1", 1, "+", score = 5), would mean "score" column tells that this alignment region was found 5 times.
overlapGrl	an integer, (default: NULL), if defined must be countOverlaps(grl, RFP), added for speed if you already have it

Value

a named vector of numeric values of scores

References

doi: 10.1242/dev.098345

See Also

Other features: computeFeaturesCage(), computeFeatures(), countOverlapsW(), disengagementScore(), distToCds(), distToTSS(), entropy(), floss(), fpkm_calc(), fpkm(), fractionLength(), initiationScore(), isInFrame(), isOverlapping(), kozakSequenceScore(), orfScore(), rankOrder(), ribosomeReleaseScore(), ribosomeStallingScore(), startRegionCoverage(), startRegion(), stopRegion(), subsetCoverage(), translationalEff()

Examples

```
# Check inside outside score of a ORF within a transcript
ORF <- GRanges("1",
               ranges = IRanges(start = c(20, 30, 40),
                                end = c(25, 35, 45)),
               strand = "+")

grl <- GRangesList(tx1_1 = ORF)

tx1 <- GRanges(seqnames = "1",
               ranges = IRanges(start = c(1, 10, 20, 30, 40, 50),
                                end = c(5, 15, 25, 35, 45, 200)),
               strand = "+")
tx <- GRangesList(tx1 = tx1)
RFP <- GRanges(seqnames = "1",
                  ranges = IRanges(start = c(1, 4, 30, 60, 80, 90),
                                   end = c(30, 33, 63, 90, 110, 120)),
                  strand = "+")

insideOutsideORF(grl, RFP, tx)
```

`install.fastp` *Download and prepare fastp trimmer*

Description

On Linux, will not run "make", only use precompiled fastp file.
On Mac OS it will use precompiled binaries.
Does not work yet for Windows!

Usage

```
install.fastp(folder = "~/bin")
```

Arguments

`folder`	path to folder for download, file will be named "fastp", this should be most recent version. On mac it will search for a folder called fastp-master inside folder given. Since there is no precompiled version of fastp for Mac OS.

Value

path to runnable fastp

References

https://www.ncbi.nlm.nih.gov/pmc/articles/PMC6129281/

Examples

```
## With default folder:
#install.fastp()

## Or set manual folder:
folder <- "~/I/WANT/IT/HERE/"
#install.fastp(folder)
```

install.sratoolkit *Download sra toolkit*

Description

Currently supported for Linux (64 bit centos and ubunutu is tested to work) and Mac-OS(64 bit)

Usage

```
install.sratoolkit(folder = "~/bin", version = "2.10.9")
```

Arguments

folder	default folder, "~/bin"
version	a string, default "2.10.9"

Value

path to fastq-dump in sratoolkit

References

https://ncbi.github.io/sra-tools/fastq-dump.html

See Also

Other sra: download.SRA.metadata(), download.SRA(), download.ebi(), rename.SRA.files()

Examples

```
# install.sratoolkit()
## Custom folder and version
folder <- "/I/WANT/IT/HERE/"
# install.sratoolkit(folder, version = "2.10.7")
```

is.grl *Helper function to check for GRangesList*

Description

Helper function to check for GRangesList

Usage

```
is.grl(class)
```

Arguments

class	the class you want to check if is GRL, either a character from class or the object itself.

Value

a boolean

See Also

Other validity: checkRFP(), checkRNA(), is.ORF(), is.gr_or_grl(), is.range(), validGRL(), validSeqlevels()

---

is.gr_or_grl *Helper function to check for GRangesList or GRanges class*

Description

Helper function to check for GRangesList or GRanges class

Usage

```
is.gr_or_grl(class)
```

Arguments

class	the class you want to check if is GRL or GR, either a character from class or the object itself.

Value

a boolean

See Also

Other validity: checkRFP(), checkRNA(), is.ORF(), is.grl(), is.range(), validGRL(), validSeqlevels()

---

is.ORF *Check if all requirements for an ORFik ORF is accepted.*

Description

Check if all requirements for an ORFik ORF is accepted.

Usage

```
is.ORF(grl)
```

Arguments

grl	a GRangesList or GRanges to check

Value

a logical (TRUE/FALSE)

See Also

Other validity: checkRFP(), checkRNA(), is.gr_or_grl(), is.grl(), is.range(), validGRL(), validSeqlevels()

`is.range` *Helper function to check for ranged object*

Description

Helper function to check for ranged object

Usage

```
is.range(class)
```

Arguments

`class`	the class you want to check if is GRL or GR, either a character from class or the object itself.

Value

a boolean

See Also

Other validity: checkRFP(), checkRNA(), is.ORF(), is.gr_or_grl(), is.grl(), validGRL(), validSeqlevels()

`isInFrame` *Find frame for each orf relative to cds*

Description

Input of this function, is the output of the function [distToCds()], or any other relative ORF frame.

Usage

```
isInFrame(dists)
```

Arguments

`dists`	a vector of integer distances between ORF and cds. 0 distance means equal frame

Details

possible outputs: 0: orf is in frame with cds 1: 1 shifted from cds 2: 2 shifted from cds

Value

a logical vector

References

doi: 10.1074/jbc.R116.733899

See Also

Other features: computeFeaturesCage(), computeFeatures(), countOverlapsW(), disengagementScore(), distToCds(), distToTSS(), entropy(), floss(), fpkm_calc(), fpkm(), fractionLength(), initiationScore(), insideOutsideORF(), isOverlapping(), kozakSequenceScore(), orfScore(), rankOrder(), ribosomeReleaseScore(), ribosomeStallingScore(), startRegionCoverage(), startRegion(), stopRegion(), subsetCoverage(), translationalEff()

Examples

```
# simple example
isInFrame(c(3,6,8,11,15))

# GRangesList example
grl <- GRangesList(tx1_1 = GRanges("1", IRanges(1,10), "+"))
fiveUTRs <- GRangesList(tx1 = GRanges("1", IRanges(1,20), "+"))
dist <- distToCds(grl, fiveUTRs)
isInFrame <- isInFrame(dist)
```

---

isOverlapping *Find frame for each orf relative to cds*

Description

Input of this function, is the output of the function [distToCds()]

Usage

```
isOverlapping(dists)
```

Arguments

dists	a vector of distances between ORF and cds

Value

a logical vector

References

doi: 10.1074/jbc.R116.733899

See Also

Other features: computeFeaturesCage(), computeFeatures(), countOverlapsW(), disengagementScore(), distToCds(), distToTSS(), entropy(), floss(), fpkm_calc(), fpkm(), fractionLength(), initiationScore(), insideOutsideORF(), isInFrame(), kozakSequenceScore(), orfScore(), rankOrder(), ribosomeReleaseScore(), ribosomeStallingScore(), startRegionCoverage(), startRegion(), stopRegion(), subsetCoverage(), translationalEff()

Examples

```
# simple example
isOverlapping(c(-3,-6,8,11,15))

# GRangesList example
grl <- GRangesList(tx1_1 = GRanges("1", IRanges(1,10), "+"))
fiveUTRs <- GRangesList(tx1 = GRanges("1", IRanges(1,20), "+"))
dist <- distToCds(grl, fiveUTRs)
isOverlapping <- isOverlapping(dist)
```

---

isPeriodic *Find if there is a periodicity of 3 in the vector*

Description

It uses Fourier transform + periodogram for finding periodic vectors on the transcript normalized counts over all CDS regions from 0 to 149, where TIS is 0.
Checks if there is a periodicity and if the periodicity is 3, more precisely between 2.9 and 3.1.

Usage

```
isPeriodic(x)
```

Arguments

x	(numeric) Vector of values to detect periodicity of 3 like in RiboSeq data.

Details

Transcript normalized means per CDS TIS region, count reads per position, divide that number per position by the total of that transcript, then sum up these numbers per position for all transcripts.

Value

a logical, if it is periodic.

kozakHeatmap *Make sequence region heatmap relative to scoring*

Description

Given sequences, DNA or RNA. And some score, ribo-seq fpkm, TE etc. Create a heatmap divided per letter in seqs, by how strong the score is.

Usage

```
kozakHeatmap(
  seqs,
  rate,
  start = 1,
  stop = max(nchar(seqs)),
  center = ceiling((stop - start + 1)/2),
  min.observations = ">q1",
  skip.startCodon = FALSE,
  xlab = "TIS",
  type = "ribo-seq"
)
```

Arguments

seqs	the sequences (character vector, DNAStringSet)
rate	a scoring vector (equal size to seqs)
start	position in seqs to start at (first is 1), default 1.
stop	position in seqs to stop at (first is 1), default max(nchar(seqs)), that is the longest sequence length
center	position in seqs to center at (first is 1), center will be +1 in heatmap
min.observations	How many observations per position per letter to accept? numeric or quantile, default (">q1", bigger than quartile 1 (25 percentile)). You can do (10), to get all with more than 10 observations.
skip.startCodon	startCodon is defined as after centering (position 1, 2 and 3). Should they be skipped ? default (FALSE). Not relevant if you are not doing Translation initiation sites (TIS).
xlab	Region you are checking, default (TIS)
type	What type is the rate scoring ? default (ribo-seq)

Details

It will create blocks around the highest rate per position

Value

a ggplot of the heatmap

Examples

```
## Not run:
if (requireNamespace("BSgenome.Hsapiens.UCSC.hg19")) {
  txdbFile <- system.file("extdata", "hg19_knownGene_sample.sqlite",
                          package = "GenomicFeatures")
  #Extract sequences of Coding sequences.
  cds <- loadRegion(txdbFile, "cds")
  tx <- loadRegion(txdbFile, "mrna")

  # Get region to check
  kozakRegions <- startRegionString(cds, tx, BSgenome.Hsapiens.UCSC.hg19::Hsapiens
                                    , upstream = 4, 5)
  # Some toy ribo-seq fpkm scores on cds
  set.seed(3)
  fpkm <- sample(1:115, length(cds), replace = TRUE)
  kozakHeatmap(kozakRegions, fpkm, 1, 9, skip.startCodon = F)
}

## End(Not run)
```

---

kozakSequenceScore *Make a score for each ORFs start region by proximity to Kozak*

Description

The closer the sequence is to the Kozak sequence the higher the score, based on the experimental pwms from article referenced. Minimum score is 0 (worst correlation), max is 1 (the best base per column was chosen).

Usage

```
kozakSequenceScore(grl, tx, faFile, species = "human", include.N = FALSE)
```

Arguments

grl	a GRangesList grouped by ORF
tx	a GRangesList, the reference area for ORFs, each ORF must have a corresponding tx.
faFile	FaFile, BSgenome, fasta/index file path or an ORFik experiment. This file is usually used to find the transcript sequences from some GRangesList.
species	("human"), which species to use, currently supports human (Homo sapiens), zebrafish (Danio rerio) and mouse (Mus musculus). Both scientific or common name for these species will work. You can also specify a pfm for your own species. Syntax of pfm is an rectangular integer matrix, where all columns must sum to the same value, normally 100. See example for more information. Rows are in order: c("A", "C", "G", "T")
include.N	logical (F), if TRUE, allow N bases to be counted as hits, score will be average of the other bases. If True, N bases will be added to pfm, automaticly, so dont include them if you make your own pfm.

Details

Ranges that does not have minimum 15 length (the kozak requirement as a sliding window of size 15 around grl start), will be set to score 0. Since they should not have the posibility to make an efficient ribosome binding.

Value

a numeric vector with values between 0 and 1

an integer vector, one score per orf

References

doi: https://doi.org/10.1371/journal.pone.0108475

See Also

Other features: computeFeaturesCage(), computeFeatures(), countOverlapsW(), disengagementScore(), distToCds(), distToTSS(), entropy(), floss(), fpkm_calc(), fpkm(), fractionLength(), initiationScore(), insideOutsideORF(), isInFrame(), isOverlapping(), orfScore(), rankOrder(), ribosomeReleaseScore(), ribosomeStallingScore(), startRegionCoverage(), startRegion(), stopRegion(), subsetCoverage(), translationalEff()

Examples

```
# Usually the ORFs are found in orfik, which makes names for you etc.
# Here we make an example from scratch
seqName <- "Chromosome"
ORF1 <- GRanges(seqnames = seqName,
                  ranges = IRanges(c(1007, 1096), width = 60),
                  strand = c("+", "+"))
ORF2 <- GRanges(seqnames = seqName,
                   ranges = IRanges(c(400, 100), width = 30),
                   strand = c("-", "-"))
ORFs <- GRangesList(tx1 = ORF1, tx2 = ORF2)
ORFs <- makeORFNames(ORFs) # need ORF names
tx <- extendLeaders(ORFs, 100)
# get faFile for sequences
faFile <- FaFile(system.file("extdata", "genome.fasta", package = "ORFik"))
kozakSequenceScore(ORFs, tx, faFile)
# For more details see vignettes.
```

---

kozak_IR_ranking *Rank kozak initiation sequences*

Description

Defined as region (-4, -1) relative to TIS

Usage

```
kozak_IR_ranking(cds_k, mrna, dt.ir, faFile, group.min = 10, species = "human")
```

Arguments

cds_k	cds ranges (GRangesList)
mrna	mrna ranges (GRangesList)
dt.ir	data.table with a column called IR, initiation rate
faFile	FaFile, BSgenome, fasta/index file path or an ORFik experiment. This file is usually used to find the transcript sequences from some GRangesList.
group.min	numeric, default 10. Minimum transcripts per initation group to be included
species	("human"), which species to use, currently supports human (Homo sapiens), zebrafish (Danio rerio) and mouse (Mus musculus). Both scientific or common name for these species will work. You can also specify a pfm for your own species. Syntax of pfm is an rectangular integer matrix, where all columns must sum to the same value, normally 100. See example for more information. Rows are in order: c("A", "C", "G", "T")

Value

a ggplot grid object

---

lastExonEndPerGroup *Get last end per granges group*

Description

Get last end per granges group

Usage

```
lastExonEndPerGroup(grl, keep.names = TRUE)
```

Arguments

grl	a GRangesList
keep.names	a boolean, keep names or not, default: (TRUE)

Value

a Rle(keep.names = T), or integer vector(F)

Examples

```
gr_plus <- GRanges(seqnames = c("chr1", "chr1"),
                   ranges = IRanges(c(7, 14), width = 3),
                   strand = c("+", "+"))
gr_minus <- GRanges(seqnames = c("chr2", "chr2"),
                    ranges = IRanges(c(4, 1), c(9, 3)),
                    strand = c("-", "-"))
grl <- GRangesList(tx1 = gr_plus, tx2 = gr_minus)
lastExonEndPerGroup(grl)
```

lastExonPerGroup *Get last exon per GRangesList group*

Description

grl must be sorted, call ORFik:::sortPerGroup if needed

Usage

```
lastExonPerGroup(grl)
```

Arguments

grl	a GRangesList

Value

a GRangesList of the last exon per group

Examples

```
gr_plus <- GRanges(seqnames = c("chr1", "chr1"),
                   ranges = IRanges(c(7, 14), width = 3),
                   strand = c("+", "+"))
gr_minus <- GRanges(seqnames = c("chr2", "chr2"),
                    ranges = IRanges(c(4, 1), c(9, 3)),
                    strand = c("-", "-"))
grl <- GRangesList(tx1 = gr_plus, tx2 = gr_minus)
lastExonPerGroup(grl)
```

lastExonStartPerGroup *Get last start per granges group*

Description

Get last start per granges group

Usage

```
lastExonStartPerGroup(grl, keep.names = TRUE)
```

Arguments

grl	a GRangesList
keep.names	a boolean, keep names or not, default: (TRUE)

Value

a Rle(keep.names = T), or integer vector(F)

Examples

```
gr_plus <- GRanges(seqnames = c("chr1", "chr1"),
                   ranges = IRanges(c(7, 14), width = 3),
                   strand = c("+", "+"))
gr_minus <- GRanges(seqnames = c("chr2", "chr2"),
                    ranges = IRanges(c(4, 1), c(9, 3)),
                    strand = c("-", "-"))
grl <- GRangesList(tx1 = gr_plus, tx2 = gr_minus)
lastExonStartPerGroup(grl)
```

---

libNames *Get library name variants*

Description

Used to standardize nomeclature for experiments.
Example: RFP is main naming, but a variant is ribo-seq ribo-seq will then be renamed to RFP

Usage

```
libNames()
```

Value

a data.table with 2 columns, the main name, and all name variants of the main name in second column as a list.

See Also

Other experiment_naming: `cellLineNames()`, `conditionNames()`, `mainNames()`, `repNames()`, `stageNames()`, `tissueNames()`

---

libraryTypes *Which type of library type in* `experiment`*?*

Description

Which type of library type in `experiment`?

Usage

```
libraryTypes(df)
```

Arguments

df	an ORFik `experiment`

Value

library types (character vector)

See Also

Other ORFik_experiment: ORFik.template.experiment(), bamVarName(), create.experiment(), experiment-class, filepath(), organism.df(), outputLibs(), read.experiment(), save.experiment(), validateExperiments()

`list.experiments` *List current experiment available*

Description

Will only search .csv extension, also exclude any experiment with the word template.

Usage

```
list.experiments(
  dir = "~/Bio_data/ORFik_experiments/",
  pattern = "*",
  libtypeExclusive = NULL,
  BPPARAM = bpparam()
)
```

Arguments

dir	directory for ORFik experiments: default: "~/Bio_data/ORFik_experiments/"
pattern	allowed patterns in experiment file name: default ("*", all experiments)
libtypeExclusive	search for experiments with exclusivly this libtype, default (NULL, all)
BPPARAM	how many cores/threads to use? default: bpparam()

Value

a data.table, 1 row per experiment with columns experiment (name), libtypes

Examples

```
## Make your experiments
df <- ORFik.template.experiment(TRUE)
df2 <- df[1:6,] # Only first 2 libs
## Save them
# save.experiment(df, "~/Bio_data/ORFik_experiments/exp1.csv")
# save.experiment(df2, "~/Bio_data/ORFik_experiments/exp1_subset.csv")
## List all experiment you have:
## Path above is default path, so no dir argument needed
#list.experiments()
#list.experiments(pattern = "subset")
## For non default directory experiments
#list.experiments(dir = "MY/CUSTOM/PATH)
```

loadRegion *Load transcript region*

Description

Usefull to simplify loading of standard regions, like cds' and leaders.

Usage

```
loadRegion(txdb, part = "tx", names.keep = NULL, by = "tx")
```

Arguments

txdb	a TxDb file or a path to one of: (.gtf ,.gff, .gff2, .gff2, .db or .sqlite), if it is a GRangesList, it will return it self.
part	a character, one of: tx, leader, cds, trailer, intron, mrna NOTE: difference between tx and mrna is that tx are all transcripts, while mrna are all transcripts with a cds
names.keep	a character vector of subset of names to keep. Example: loadRegions(txdb, names = ENST1000005), will return only that transcript. Remember if you set by to "gene", then this list must be with gene names.
by	a character, default "tx" Either "tx" or "gene". What names to output region by, the transcript name "tx" or gene names "gene"

Details

Load as GRangesList if input is not already GRangesList.

Value

a GrangesList of region

Examples

```
gtf <- system.file("extdata", "annotations.gtf", package = "ORFik")
loadRegion(gtf, "cds")
loadRegion(gtf, "intron")
```

loadRegions *Get all regions of transcripts specified to environment*

Description

By default loads all parts to .GlobalEnv (global environemnt) Useful to not spend time on finding the functions to load regions.

Usage

```
loadRegions(
  txdb,
  parts = c("mrna", "leaders", "cds", "trailers"),
  extension = "",
  names.keep = NULL,
  by = "tx",
  envir = .GlobalEnv
)
```

Arguments

txdb	a TxDb file, a path to one of: (.gtf ,.gff, .gff2, .gff2, .db or .sqlite) or an ORFik experiment
parts	the transcript parts you want, default: c("mrna", "leaders", "cds", "trailers"). See ?loadRegion for more info on this argument.
extension	What to add on the name after leader, like: B -> leadersB
names.keep	a character vector of subset of names to keep. Example: loadRegions(txdb, names = ENST1000005), will return only that transcript. Remember if you set by to "gene", then this list must be with gene names.
by	a character, default "tx" Either "tx" or "gene". What names to output region by, the transcript name "tx" or gene names "gene"
envir	Which environment to save to, default: .GlobalEnv

Value

invisible(NULL) (regions saved in envir)

Examples

```
# Load all mrna regions to Global environment
gtf <- system.file("extdata", "annotations.gtf", package = "ORFik")
loadRegions(gtf, parts = c("mrna", "leaders", "cds", "trailers"))
```

---

loadTranscriptType *Load transcripts of given biotype*

Description

Like rRNA, snoRNA etc. NOTE: Only works on gtf/gff, not .db object for now. Also note that these anotations are not perfect, some rRNA annotations only contain 5S rRNA etc. If your gtf does not contain evertyhing you need, use a resource like repeatmasker and download a gtf: https://genome.ucsc.edu/cgi-bin/hgTables

Usage

```
loadTranscriptType(object, part = "rRNA", tx = NULL)
```

Arguments

object	a TxDb, ORFik experiment or path to gtf/gff,
part	a character, default rRNA. Can also be: snoRNA, tRNA etc. As long as that biotype is defined in the gtf.
tx	a GRangesList of transcripts (Optional, default NULL, all transcript of that type), else it must be names a list to subset on.

Value

a GRangesList of transcript of that type

References

doi: 10.1002/0471250953.bi0410s25

---

loadTxdb *General loader for txdb*

Description

Useful to allow fast TxDb loader like .db

Usage

```
loadTxdb(txdb, chrStyle = NULL)
```

Arguments

txdb	a TxDb file, a path to one of: (.gtf ,.gff, .gff2, .gff2, .db or .sqlite) or an ORFik experiment
chrStyle	a GRanges object, TxDb, FaFile, or a seqlevelsStyle (Default: NULL) to get seqlevelsStyle from. Is chromosome 1 called chr1 or 1, is mitocondrial chromosome called MT or chrM etc. Will use 1st seqlevel-style if more are present. Like: c("NCBI", "UCSC") -> pick "NCBI"

Value

a TxDb object

Examples

```
library(GenomicFeatures)
# Get the gtf txdb file
txdbFile <- system.file("extdata", "hg19_knownGene_sample.sqlite",
                        package = "GenomicFeatures")
txdb <- loadDb(txdbFile)
```

longestORFs *Get longest ORF per stop site*

Description

Rule: if seqname, strand and stop site is equal, take longest one. Else keep. If IRangesList or IRanges, seqnames are groups, if GRanges or GRangesList seqnames are the seqlevels (e.g. chromosomes/transcripts)

Usage

```
longestORFs(grl)
```

Arguments

grl	a GRangesList/IRangesList, GRanges/IRanges of ORFs

Value

a GRangesList/IRangesList, GRanges/IRanges (same as input)

See Also

Other ORFHelpers: defineTrailer(), mapToGRanges(), orfID(), startCodons(), startSites(), stopCodons(), stopSites(), txNames(), uniqueGroups(), uniqueOrder()

Examples

```
ORF1 = GRanges("1", IRanges(10,21), "+")
ORF2 = GRanges("1", IRanges(1,21), "+") # <- longest
grl <- GRangesList(ORF1 = ORF1, ORF2 = ORF2)
longestORFs(grl) # get only longest
```

mainNames *Get main name from variant name*

Description

Used to standardize nomeclature for experiments.
Example: RFP is main naming, but a variant is ribo-seq ribo-seq will then be renamed to RFP

Usage

```
mainNames(names, dt)
```

Arguments

names	a character vector of names that must exist in dt$allNames
dt	a data.table with 2 columns (mainName, allNames)

Value

a data.table with 2 columns, the main name, and all name variants of the main name in second column as a list.

See Also

Other experiment_naming: `cellLineNames()`, `conditionNames()`, `libNames()`, `repNames()`, `stageNames()`, `tissueNames()`

`makeExonRanks` *Make grouping by exons ranks*

Description

There are two ways to make vector of exon ranking: 1. Iterate per exon in ORF, byTranscript = FALSE 2. Iterate per ORF in transcript, byTranscript = TRUE.

Usage

```
makeExonRanks(grl, byTranscript = FALSE)
```

Arguments

`grl`	a `GRangesList`
`byTranscript`	logical (default: FALSE), groups orfs by transcript name or ORF name, if ORfs are by transcript, check duplicates.

Details

Either by transcript or by original groupings. Must be ordered, so that same transcripts are ordered together.

Value

an integer vector of indices for exon ranks

`makeORFNames` *Make ORF names per orf*

Description

grl must be grouped by transcript If a list of orfs are grouped by transcripts, but does not have ORF names, then create them and return the new GRangesList

Usage

```
makeORFNames(grl, groupByTx = TRUE)
```

Arguments

grl	a GRangesList
groupByTx	logical (T), should output GRangesList be grouped by transcripts (T) or by ORFs (F)?

Value

(GRangesList) with ORF names, grouped by transcripts, sorted.

Examples

```
gr_plus <- GRanges(seqnames = c("chr1", "chr1"),
                   ranges = IRanges(c(7, 14), width = 3),
                   strand = c("+", "+"))
gr_minus <- GRanges(seqnames = c("chr2", "chr2"),
                    ranges = IRanges(c(4, 1), c(9, 3)),
                    strand = c("-", "-"))
grl <- GRangesList(tx1 = gr_plus, tx2 = gr_minus)
makeORFNames(grl)
```

---

makeSummarizedExperimentFromBam

Make a count matrix from a library or experiment

Description

Make a summerizedExperiment / matrix object from bam files

Usage

```
makeSummarizedExperimentFromBam(
  df,
  saveName = NULL,
  longestPerGene = TRUE,
  geneOrTxNames = "tx",
  region = "mrna",
  type = "count",
  lib.type = "ofst",
  weight = "score"
)
```

Arguments

df	an ORFik experiment
saveName	a character (default NULL), if set save experiment to path given. Always saved as .rds., it is optional to add .rds, it will be added for you if not present. Also used to load existing file with that name.
longestPerGene	a logical (default TRUE), if FALSE all transcript isoforms per gene.
geneOrTxNames	a character vector (default "tx"), should row names keep trancript names ("tx") or change to gene names ("gene")

region	a character vector (default: "mrna"), make raw count matrices of whole mrnas or one of (leaders, cds, trailers). Can also be a GRangesList, then it uses this region directly.
type	default: "count" (raw counts matrix), alternative is "fpkm", "log2fpkm" or "log10fpkm"
lib.type	a character(default: "default"), load files in experiment or some precomputed variant, either "ofst", "bedo", "bedoc" or "pshifted". These are made with ORFik:::convertLibs() or shiftFootprintsByExperiment(). Can also be custom user made folders inside the experiments bam folder.
weight	numeric or character, a column to score overlaps by. Default "score", will check for a metacolumn called "score" in libraries. If not found, will not use weights.

Details

If txdb or gtf path is added, it is a rangedSummerizedExperiment NOTE: If the file called saveName exists, it will then load file, not remake it!

Value

a SummarizedExperiment object or data.table if "type" is not "count, with rownames as transcript / gene names.

Examples

```
##Make experiment
df <- ORFik.template.experiment()
# makeSummarizedExperimentFromBam(df)
# Only cds (coding sequences):
# makeSummarizedExperimentFromBam(df, region = "cds")
# FPKM instead of raw counts on whole mrna regions
# makeSummarizedExperimentFromBam(df, type = "fpkm")
```

---

mapToGRanges *Map orfs to genomic coordinates*

Description

Creates GRangesList from the results of ORFs_as_List and the GRangesList used to find the ORFs

Usage

```
mapToGRanges(grl, result, groupByTx = TRUE)
```

Arguments

grl	A GRangesList of the original sequences that gave the orfs in Genomic coordinates.
result	IRangesList A list of the results of finding uorfs list syntax is: Per list group in IRangesList is per grl index. In transcript coordinates. The names are grl index as character.
groupByTx	logical (T), should output GRangesList be grouped by transcripts (T) or by ORFs (F)?

Details

There is no check on invalid matches, so be carefull if you use this function directly.

Value

A GRangesList of ORFs.

See Also

Other ORFHelpers: defineTrailer(), longestORFs(), orfID(), startCodons(), startSites(), stopCodons(), stopSites(), txNames(), uniqueGroups(), uniqueOrder()

---

matchColors *Match coloring of coverage plot*

Description

Check that colors match with the number of fractions.

Usage

```
matchColors(coverage, colors)
```

Arguments

coverage	a data.table with coverage
colors	a character vector of colors

Value

number of genes in coverage

---

matchNaming *Match naming of GRangesList*

Description

Given a GRangesList and a reference, make the naming convention and the number of metacolumns equal to reference

Usage

```
matchNaming(gr, reference)
```

Arguments

gr	a GRangesList or GRanges object
reference	a GRangesList of a reference

Value

a GRangesList

matchSeqStyle *A wrapper for seqlevelsStyle*

Description

To make sure chromosome naming is correct (chr1 vs 1 vs I etc)

Usage

```
matchSeqStyle(range, chrStyle = NULL)
```

Arguments

range	a ranged object, (GRanges, GAlignment etc)
chrStyle	a GRanges object, TxDb, FaFile, or a seqlevelsStyle (Default: NULL) to get seqlevelsStyle from. Is chromosome 1 called chr1 or 1, is mitocondrial chromosome called MT or chrM etc. Will use 1st seqlevel-style if more are present. Like: c("NCBI", "UCSC") -> pick "NCBI"

Value

a GAlignment/GRanges object depending on input.

mergeFastq *Merge groups of Fastq /Fasta files*

Description

Will use multithreading to speed up process. Only works for Unix OS (Linux and Mac)

Usage

```
mergeFastq(in_files, out_files, BPPARAM = bpparam())
```

Arguments

in_files	character specify the full path to the individual fastq.gz files. Seperated by space per file in group: For 2 output files from 4 input files: in_files <- c("file1.fastq file2.fastq". "file3.fastq file4.fastq")
out_files	character specify the path to the FASTQ directory For 2 output files: out_files <- c("/merged/file1&2.fastq", "/merged/file3&4.fastq")
BPPARAM	how many cores/threads to use? default: bpparam(). To see number of threads used, do bpparam()$workers

Value

invisible(NULL).

Examples

```
fastq.folder <- tempdir() # <- Your fastq files
infiles <- dir(fastq.folder, "*.fastq", full.names = TRUE)
## Not run:
# Seperate files into groups (here it is 4 output files from 12 input files)
in_files <- c(paste0(grep(infiles, pattern = paste0("ribopool-",
               seq(11, 14), collapse = "|"), value = TRUE), collapse = " "),
              paste0(grep(infiles, pattern = paste0("ribopool-",
               seq(18, 19), collapse = "|"), value = TRUE), collapse = " "),
              paste0(grep(infiles, pattern = paste0("C11-",
               seq(11, 14), collapse = "|"), value = TRUE), collapse = " "),
              paste0(grep(infiles, pattern = paste0("C11-",
               seq(18, 19), collapse = "|"), value = TRUE), collapse = " "))

out_files <- paste0(c("SSU_ribopool", "LSU_ribopool", "SSU_WT", "LSU_WT"), ".fastq.gz")
merged.fastq.folder <- file.path(fastq.folder, "merged/")
out_files <- file.path(merged.fastq.folder, out_files)

mergeFastq(in_files, out_files)

## End(Not run)
```

`metaWindow` *Calculate meta-coverage of reads around input GRanges/List object.*

Description

Sums up coverage over set of GRanges objects as a meta representation.

Usage

```
metaWindow(
  x,
  windows,
  scoring = "sum",
  withFrames = FALSE,
  zeroPosition = NULL,
  scaleTo = 100,
  fraction = NULL,
  feature = NULL,
  forceUniqueEven = !is.null(scoring),
  forceRescale = TRUE,
  weight = "score"
)
```

Arguments

`x`	GRanges/GAlignment object of your reads. Remember to resize them beforehand to width of 1 to focus on 5' ends of footprints etc, if that is wanted.
`windows`	GRangesList or GRanges of your ranges
`scoring`	a character, default: "sum", one of (zscore, transcriptNormalized, mean, median, sum, sumLength, NULL), see ?coverageScorings for info and more alternatives.

withFrames — a logical (TRUE), return positions with the 3 frames, relative to zeroPosition. zeroPosition is frame 0.

zeroPosition — an integer DEFAULT (NULL), the point if all windows are equal size, that should be set to position 0. Like leaders and cds combination, then 0 is the TIS and -1 is last base in leader. NOTE!: if windows have different widths, this will be ignored.

scaleTo — an integer (100), if windows have different size, a meta window can not directly be created, since a meta window must have equal size for all windows. Rescale (bin) all windows to scaleTo. i.e c(1,2,3) -> size 2 -> coverage of position c(1, mean(2,3)) etc.

fraction — a character/integer (NULL), the fraction i.e (27) for read length 27, or ("LSU") for large sub-unit TCP-seq.

feature — a character string, info on region. Usually either gene name, transcript part like cds, leader, or CpG motifs etc.

forceUniqueEven, — a logical (TRUE), if TRUE; require that all windows are of same width and even. To avoid bugs. FALSE if score is NULL.

forceRescale — logical, default TRUE. If TRUE, if `unique(widthPerGroup(windows))` has length > 1, it will force all windows to width of the `scaleTo` argument, making a binned meta coverage.

weight — (default: 'score'), if defined a character name of valid meta column in subject. GRanges("chr1", 1, "+", score = 5), would mean score column tells that this alignment region was found 5 times. ORFik .bedo files, contains a score column like this. As do CAGEr CAGE files and many other package formats. You can also assign a score column manually.

Value

A data.table with scored counts (score) of reads mapped to positions (position) specified in windows along with frame (frame).

See Also

Other coverage: `coverageScorings()`, `regionPerReadLength()`, `scaledWindowPositions()`, `windowPerReadLength()`

Examples

```
library(GenomicRanges)
windows <- GRangesList(GRanges("chr1", IRanges(c(50, 100), c(80, 200)),
                               "-"))
x <- GenomicRanges::GRanges(
  seqnames = "chr1",
  ranges =  IRanges::IRanges(c(100, 180), c(200, 300)),
  strand = "-")
metaWindow(x, windows, withFrames = FALSE)
```

`nrow,experiment-method` *Internal nrow function for ORFik experiment Number of runs in experiment*

Description

Internal nrow function for ORFik experiment Number of runs in experiment

Usage

```
## S4 method for signature 'experiment'
nrow(x)
```

Arguments

`x`	an ORFik `experiment`

Value

number of rows in experiment (integer)

`numCodons` *Get number of codons*

Description

Length of object / 3. Choose either only whole codons, or with stubs. ORF stubs are not relevant, since there are no correctly defined ORFs that are 17 bases long etc.

Usage

```
numCodons(grl, as.integer = TRUE, keep.names = FALSE)
```

Arguments

`grl`	a `GRangesList` object
`as.integer`	a logical (TRUE), remove stub codons
`keep.names`	a logical (FALSE)

Value

an integer vector

numExonsPerGroup *Get list of the number of exons per group*

Description

Can also be used generaly to get number of GRanges object per GRangesList group

Usage

```
numExonsPerGroup(grl, keep.names = TRUE)
```

Arguments

grl	a GRangesList
keep.names	a logical, keep names or not, default: (TRUE)

Value

an integer vector of counts

Examples

```
gr_plus <- GRanges(seqnames = c("chr1", "chr1"),
                   ranges = IRanges(c(7, 14), width = 3),
                   strand = c("+", "+"))
gr_minus <- GRanges(seqnames = c("chr2", "chr2"),
                    ranges = IRanges(c(4, 1), c(9, 3)),
                    strand = c("-", "-"))
grl <- GRangesList(tx1 = gr_plus, tx2 = gr_minus)
numExonsPerGroup(grl)
```

optimizeReads *Find optimized subset of valid reads*

Description

Keep only the ones that overlap within the grl ranges. Also sort them in the end

Usage

```
optimizeReads(grl, reads)
```

Arguments

grl	a GRangesList or GRanges object
reads	a GRanges, GAlignment or GAlignmentPairs object

Value

the reads as GRanges, GAlignment or GAlignmentPairs

See Also

Other utils: bedToGR(), convertToOneBasedRanges(), export.bed12(), export.wiggle(), fimport(), findFa(), fread.bed(), readBam(), readWig()

`orfID` *Get id's for each orf*

Description

These id's can be uniqued by isoform etc, this is not supported by GenomicRanges.

Usage

```
orfID(grl, with.tx = FALSE)
```

Arguments

grl	a GRangesList
with.tx	a boolean, include transcript names, if you want unique orfs, so that they dont have multiple versions on different isoforms, set it to FALSE.

Value

a character vector of ids, 1 per orf

See Also

Other ORFHelpers: defineTrailer(), longestORFs(), mapToGRanges(), startCodons(), startSites(), stopCodons(), stopSites(), txNames(), uniqueGroups(), uniqueOrder()

`ORFik.template.experiment` *An ORFik experiment to see how it looks*

Description

NOTE! This experiment should only be used for testing, since it is just sampled data internal in ORFik.

Usage

```
ORFik.template.experiment(as.temp = FALSE)
```

Arguments

as.temp	logical, default FALSE, load as ORFik experiment. If TRUE, loads as data.frame template of the experiment.

Value

an ORFik experiment

See Also

Other ORFik_experiment: bamVarName(), create.experiment(), experiment-class, filepath(), libraryTypes(), organism.df(), outputLibs(), read.experiment(), save.experiment(), validateExperiments()

Examples

```
ORFik.template.experiment()
```

ORFikQC *A post Alignment quality control of reads*

Description

The ORFik QC uses the aligned files (usually bam files), fastp and STAR log files combined with annotation to create relevant statistics.

This report consists of several steps:
1. Convert bam file / Input files to ".ofst" format, if not already done. This format is around 400x faster to use in R than the bam format.
2. From this report you will get a summary csv table, with distribution of aligned reads and overlap counts over transcript regions like: leader, cds, trailer, lincRNAs, tRNAs, rRNAs, snoRNAs etc. It will be called STATS.csv. And can be imported with QCstats function.
3. It will also make correlation plots and meta coverage plots, so you get a good understanding of how good the quality of your NGS data production + aligner step were.
4. Count tables are produced, similar to HTseq count tables. Over mrna, leader, cds and trailer separately. This tables are stored as SummarizedExperiment, for easy loading into DEseq, conversion to normalized fpkm values, or collapsing replicates in an experiment. And can be imported with countTable function.
Everything will be outputed in the directory of your NGS data, inside the folder ./QC_STATS/, relative to data location in 'df'. You can specify new out location with out.dir if you want.
To make a ORFik experiment, see ?ORFik::experiment
To see some normal mrna coverage profiles of different RNA-seq protocols: https://www.ncbi.nlm.nih.gov/pmc/articles/P

Usage

```
ORFikQC(df, out.dir = dirname(df$filepath[1]), BPPARAM = bpparam())
```

Arguments

df	an ORFik experiment
out.dir	optional output directory, default: dirname(df$filepath[1]). Will make a folder called "QC_STATS" with all results in this directory.
BPPARAM	how many cores/threads to use? default: bpparam(). To see number of threads used, do bpparam()$workers

Value

invisible(NULL) (objects are stored to disc)

See Also

Other QC report: `QCplots()`, `QCstats()`

Examples

```
# Load an experiment
df <- ORFik.template.experiment()
# Run QC
# QCreport(df)
```

`orfScore` *Get ORFscore for a GRangesList of ORFs*

Description

ORFscore tries to check whether the first frame of the 3 possible frames in an ORF has more reads than second and third frame. IMPORTANT: Only use p-shifted libraries, see (`detectRibosomeShifts`). Else this score makes no sense.

Usage

```
orfScore(grl, RFP, is.sorted = FALSE, weight = "score", overlapGrl = NULL)
```

Arguments

`grl`	a `GRangesList` of 5' utrs, CDS, transcripts, etc.
`RFP`	ribosomal footprints, given as `GAlignments` or `GRanges` object, must be already shifted and resized to the p-site. Requires a $size column with original read lengths.
`is.sorted`	logical (FALSE), is grl sorted. That is + strand groups in increasing ranges (1,2,3), and - strand groups in decreasing ranges (3,2,1)
`weight`	(default: 'score'), if defined a character name of valid meta column in subject. GRanges("chr1", 1, "+", score = 5), would mean score column tells that this alignment region was found 5 times. ORFik .bedo files, contains a score column like this. As do CAGEr CAGE files and many other package formats. You can also assign a score column manually.
`overlapGrl`	an integer, (default: NULL), if defined must be countOverlaps(grl, RFP), added for speed if you already have it

Details

Pseudocode: assume rff - is reads fraction in specific frame

```
ORFScore = log(rrf1 + rrf2 + rrf3)
```

If rrf2 or rrf3 is bigger than rff1, negate the resulting value.

```
ORFScore[rrf1Smaller] <- ORFScore[rrf1Smaller] * -1
```

As result there is one value per ORF: Positive values say that the first frame have the most reads, negative values say that the first frame does not have the most reads. NOTE: If reads are not of width 1, then a read from 1-4 on range of 1-4, will get scores frame1 = 2, frame2 = 1, frame3 = 1. What could be logical is that only the 5' end is important, so that only frame1 = 1, to get this, you first resize reads to 5'end only.

NOTES: 1. p shifting is not exact, so some functional ORFs will get a bad ORF score.
2. If a score column is defined, it will use it as weights, set to weight = 1L if you don't have weight, and score column is something else. see `getWeights`

Value

a data.table with 4 columns, the orfscore (ORFScores) and score of each of the 3 tiles (frame_zero_RP, frame_one_RP, frame_two_RP)

References

doi: 10.1002/embj.201488411

Other features: `computeFeaturesCage()`, `computeFeatures()`, `countOverlapsW()`, `disengagementScore()`, `distToCds()`, `distToTSS()`, `entropy()`, `floss()`, `fpkm_calc()`, `fpkm()`, `fractionLength()`, `initiationScore()`, `insideOutsideORF()`, `isInFrame()`, `isOverlapping()`, `kozakSequenceScore()`, `rankOrder()`, `ribosomeReleaseScore()`, `ribosomeStallingScore()`, `startRegionCoverage()`, `startRegion()`, `stopRegion()`, `subsetCoverage()`, `translationalEff()`

Examples

```
ORF <- GRanges(seqnames = "1",
               ranges = IRanges(start = c(1, 10, 20), end = c(5, 15, 25)),
               strand = "+")
names(ORF) <- c("tx1", "tx1", "tx1")
grl <- GRangesList(tx1_1 = ORF)
RFP <- GRanges("1", IRanges(25, 25), "+") # 1 width position based
score(RFP) <- 28 # original width
orfScore(grl, RFP) # negative because more hits on frames 1,2 than 0.

# example with positive result, more hits on frame 0 (in frame of ORF)
RFP <- GRanges("1", IRanges(c(1, 1, 1, 25), width = 1), "+")
score(RFP) <- c(28, 29, 31, 28) # original width
orfScore(grl, RFP)
```

---

organism.df *Get organism of the ORFik experiment*

Description

Uses the txdb / gtf organism information, if existing.

Usage

```
organism.df(df)
```

Arguments

df	an ORFik experiment

Value

organism (character vector), if no organism set: NA

See Also

Other ORFik_experiment: ORFik.template.experiment(), bamVarName(), create.experiment(), experiment-class, filepath(), libraryTypes(), outputLibs(), read.experiment(), save.experiment(), validateExperiments()

Examples

```
# if you have set organism in txdb of
# ORFik experiment:
df <- ORFik.template.experiment()
#organism.df(df)

#' If you have not set the organism you can do:
#txdb <- GenomicFeatures::makeTxDbFromGFF("pat/to/gff_or_gff")
#BiocGenerics::organism(txdb) <- "Homo sapiens"
#saveDb(txdb, paste0("pat/to/gff_or_gff", ".db"))
# then use this txdb in you ORFik experiment and load:
# create.experiment(exper = "new_experiment",
#   txdb = paste0("pat/to/gff_or_gff", ".db")) ...
# organism.df(read.experiment("new-experiment"))
```

---

outputLibs *Output bam/bed/bedo/bedoc/ofst/wig files to R as variables*

Description

Variable names defined by df (ORFik experiment DataFrame) Uses multiple cores to load, defined by multicoreParam

Usage

```
outputLibs(
  df,
  chrStyle = NULL,
  type = "default",
  param = NULL,
  strandMode = 0,
  envir = .GlobalEnv,
  BPPARAM = bpparam()
)
```

Arguments

df	an ORFik experiment
chrStyle	a GRanges object, TxDb, FaFile, or a seqlevelsStyle (Default: NULL) to get seqlevelsStyle from. Is chromosome 1 called chr1 or 1, is mitocondrial chromosome called MT or chrM etc. Will use 1st seqlevel-style if more are present. Like: c("NCBI", "UCSC") -> pick "NCBI"
type	a character(default: "default"), load files in experiment or some precomputed variant, either "ofst", "bedo", "bedoc" or "pshifted". These are made with ORFik:::convertLibs() or shiftFootprintsByExperiment(). Can also be custom user made folders inside the experiments bam folder.
param	NULL or a ScanBamParam object. Like for scanBam, this influences what fields and which records are imported. However, note that the fields specified thru this ScanBamParam object will be loaded *in addition* to any field required for generating the returned object (GAlignments, GAlignmentPairs, or GappedReads object), but only the fields requested by the user will actually be kept as metadata columns of the object. By default (i.e. param=NULL or param=ScanBamParam()), no additional field is loaded. The flag used is scanBamFlag(isUnmappedQuery=FALSE) for readGAlignments, readGAlignmentsList, and readGappedReads. (i.e. only records corresponding to mapped reads are loaded), and scanBamFlag(isUnmappedQuery=FALSE,isPaired=TRUE,has for readGAlignmentPairs (i.e. only records corresponding to paired-end reads with both ends mapped are loaded).
strandMode	numeric, default 0. Only used for paired end bam files. One of (0: strand = *, 1: first read of pair is +, 2: first read of pair is -). See ?strandMode. Note: Sets default to 0 instead of 1, as readGAlignmentPairs uses 1. This is to guarantee hits, but will also make mismatches of overlapping transcripts in opposite directions.
envir	environment to save to, default (.GlobalEnv)
BPPARAM	how many cores/threads to use? default: bpparam(). To see number of threads used, do bpparam()$workers

Value

NULL (libraries set by envir assignment)

See Also

Other ORFik_experiment: ORFik.template.experiment(), bamVarName(), create.experiment(), experiment-class, filepath(), libraryTypes(), organism.df(), read.experiment(), save.experiment(), validateExperiments()

Examples

```
## Load a template ORFik experiment
df <- ORFik.template.experiment()
## Default library type load, usually bam files
# outputLibs(df, type = "default")
## .ofst file load, if ofst files does not exists
## it will load default
# outputLibs(df, type = "ofst")
## .wig file load, if wiggle files does not exists
```

```
## it will load default
# outputLibs(df, type = "wig")
```

`pasteDir` *A paste function for directories Makes sure slashes are corrected, and not doubled.*

Description

A paste function for directories Makes sure slashes are corrected, and not doubled.

Usage

```
pasteDir(...)
```

Arguments

`...`	any amount of arguments that are possible to convert to characters

Value

the pasted string

`percentage_to_ratio` *Convert percentage to ratio of 1*

Description

50 -> 0.5 etc, if length cds > minimum.cds

Usage

```
percentage_to_ratio(top_tx, cds, minimum.cds = 1000)
```

Arguments

`top_tx`	numeric
`cds`	GRangesList object
`minimum.cds`	numeric, default 1000

Value

numeric, as ratio of 1

plotHelper *Helper function for coverage plots*

Description

Should only be used internally

Usage

```
plotHelper(
  coverage,
  df,
  outdir,
  scores,
  returnCoverage = FALSE,
  title = "coverage metaplot",
  colors = c("skyblue4", "orange"),
  plotFunction = "windowCoveragePlot"
)
```

Arguments

coverage	a data.table containing at least columns (count/score, position), it is possible to have additionals: (genes, fraction, feature)
df	an ORFik experiment
outdir	directory to save to (default: NULL, no saving)
scores	scoring function (default: c("sum", "zscore")), see ?coverageScorings for possible scores.
returnCoverage	(defualt: FALSE), return the ggplot object (TRUE) or NULL (FALSE).
title	Title to give plot
colors	Which colors to use, default auto color from function experiment.colors, new color per library type. Else assign colors yourself.
plotFunction	Which plot function, default: windowCoveragePlot

Value

NULL (or ggplot object if returnCoverage is TRUE)

pmapFromTranscriptF *Faster pmapFromTranscript*

Description

Map range coordinates between features in the transcriptome and genome (reference) space. The length of x must be the same as length of transcripts. Only exception is if x have integer names like (1, 3, 3, 5), so that x[1] maps to 1, x[2] maps to transcript 3 etc.

Usage

```
pmapFromTranscriptF(x, transcripts, removeEmpty = FALSE)
```

Arguments

x	IRangesList/IRanges/GRanges to map to genomic coordinates
transcripts	a GRangesList to map against (the genomic coordinates)
removeEmpty	a logical, remove non hit exons, else they are set to 0. That is all exons in the reference that the transcript coordinates do not span.

Details

This version tries to fix the short commings of GenomicFeature's version. Much faster and uses less memory. Implemented as dynamic program optimized c++ code.

Value

a GRangesList of mapped reads, names from ranges are kept.

Examples

```
ranges <- IRanges(start = c( 5, 6), end = c(10, 10))
seqnames = rep("chr1", 2)
strands = rep("-", 2)
grl <- split(GRanges(seqnames, IRanges(c(85, 70), c(89, 82)), strands),
             c(1, 1))
ranges <- split(ranges, c(1,1)) # both should be mapped to transcript 1
pmapFromTranscriptF(ranges, grl, TRUE)
```

---

pmapToTranscriptF *Faster pmapToTranscript*

Description

Map range coordinates between features in the transcriptome and genome (reference) space. The length of x must be the same as length of transcripts. Only exception is if x have integer names like (1, 3, 3, 5), so that x[1] maps to 1, x[2] maps to transcript 3 etc.

Usage

```
pmapToTranscriptF(
  x,
  transcripts,
  ignore.strand = FALSE,
  x.is.sorted = TRUE,
  tx.is.sorted = TRUE
)
```

Arguments

x	GRangesList/GRanges/IRangesList/IRanges to map to transcriptomic coordinates
transcripts	a GRangesList/GRanges/IRangesList/IRanges to map against (the genomic coordinates). Must be of lower abstraction level than x. So if x is GRanges, transcripts can not be IRanges etc.
ignore.strand	When ignore.strand is TRUE, strand is ignored in overlaps operations (i.e., all strands are considered "+") and the strand in the output is '*'. When ignore.strand is FALSE (default) strand in the output is taken from the transcripts argument. When transcripts is a GRangesList, all inner list elements of a common list element must have the same strand or an error is thrown. Mapped position is computed by counting from the transcription start site (TSS) and is not affected by the value of ignore.strand.
x.is.sorted	if x is a GRangesList object, are "-" strand groups pre-sorted in decreasing order within group, default: TRUE
tx.is.sorted	if transcripts is a GRangesList object, are "-" strand groups pre-sorted in decreasing order within group, default: TRUE

Details

This version tries to fix the shortcommings of GenomicFeature's version. Much faster and uses less memory. Implemented as dynamic program optimized c++ code.

Value

object of same class as input x, names from ranges are kept.

Examples

```
ranges <- IRanges(start = c(5, 6), end = c(10, 10))
seqnames = rep("chr1", 2)
strands = rep("-", 2)
grl <- split(GRanges(seqnames, IRanges(c(85, 70), c(89, 82)), strands),
             c(1, 1))
ranges <- split(ranges, c(1,1)) # both should be mapped to transcript 1
pmapFromTranscriptF(ranges, grl, TRUE)
```

---

prettyScoring *Prettify scoring name*

Description

Prettify scoring name

Usage

```
prettyScoring(scoring)
```

Arguments

scoring	a character (the scoring)

Value

a new scoring name or the same if pretty

---

pseudo.transform *Transform object*

Description

Similar to normal transform like log2 or log10. But keep 0 values as 0, to avoid Inf values and negtive values are made as -scale(abs(x)), to avoid NaN values.

Usage

```
pseudo.transform(x, scale = log2, by.reference = FALSE)
```

Arguments

x	a numeric vector or data.frame/data.table of numeric columns
scale	a function, default log2, which function to transform with.
by.reference	logical, FALSE. if TRUE, update object by reference if it is data.table.

Value

same object class as x, with transformed values

---

pSitePlot *Plot area around TIS as histogram*

Description

Usefull to validate p-shifting is correct Can be used for any coverage of region around a point, like TIS, TSS, stop site etc.

Usage

```
pSitePlot(
  hitMap,
  length = 29,
  region = "start",
  output = NULL,
  type = "canonical CDS",
  scoring = "Averaged counts",
  forHeatmap = FALSE
)
```

Arguments

hitMap	a data.frame/data.table, given from metaWindow (must have columns: position, (score or count) and frame)
length	an integer (29), which length is this for?
region	a character (start), either "start or "stop"
output	character (NULL), if set, saves the plot as pdf or png to path given. If no format is given, is save as pdf.
type	character (canonical CDS), type for plot
scoring	character, default: (Averaged counts), which scoring did you use ? see ?coverageScorings for info and more alternatives.
forHeatmap	a logical (FALSE), should the plot be part of a heatmap? It will scale it differently. Removing title, x and y labels, and truncate spaces between bars.

Details

The region is represented as a histogram with different colors for the 3 frames. To make it easy to see patterns in the reads. Remember if you want to change anything like colors, just return the ggplot object, and reassign like: obj + scale_color_brewer() etc.

Value

a ggplot object of the coverage plot, NULL if output is set, then the plot will only be saved to location.

See Also

Other coveragePlot: coverageHeatMap(), savePlot(), windowCoveragePlot()

Examples

```
# An ORF
grl <- GRangesList(tx1 = GRanges("1", IRanges(1, 6), "+"))
# Ribo-seq reads
range <- IRanges(c(rep(1, 3), 2, 3, rep(4, 2), 5, 6), width = 1 )
reads <- GRanges("1", range, "+")
coverage <- coveragePerTiling(grl, reads, TRUE, as.data.table = TRUE,
                              withFrames = TRUE)
pSitePlot(coverage)

# See vignette for more examples
```

QCplots *Correlation and coverage plots for ORFikQC*

Description

Correlation plots default to mRNA covering reads. Meta plots defaults to leader, cds, trailer.
Output will be stored in same folder as the libraries in df.
Correlation plots will be fpkm correlation and log2(fpkm + 1) correlation between samples.

Usage

```
QCplots(
  df,
  region = "mrna",
  stats_folder = paste0(dirname(df$filepath[1]), "/QC_STATS/"),
  BPPARAM
)
```

Arguments

df	an ORFik experiment
region	a character (default: mrna), make raw count matrices of whole mrnas or one of (leaders, cds, trailers)
stats_folder	directory to save, default: paste0(dirname(df$filepath[1]), "/QC_STATS/")
BPPARAM	how many cores/threads to use? default: bpparam(). To see number of threads used, do bpparam()$workers

Details

Is part of QCreport

Value

invisible(NULL) (objects stored to disc)

See Also

Other QC report: QCreport(), QCstats()

QCreport *A post Alignment quality control of reads*

Description

The ORFik QC uses the aligned files (usually bam files), fastp and STAR log files combined with annotation to create relevant statistics.

This report consists of several steps:
1. Convert bam file / Input files to ".ofst" format, if not already done. This format is around 400x faster to use in R than the bam format.
2. From this report you will get a summary csv table, with distribution of aligned reads and overlap counts over transcript regions like: leader, cds, trailer, lincRNAs, tRNAs, rRNAs, snoRNAs etc. It will be called STATS.csv. And can be imported with QCstats function.
3. It will also make correlation plots and meta coverage plots, so you get a good understanding of how good the quality of your NGS data production + aligner step were.
4. Count tables are produced, similar to HTseq count tables. Over mrna, leader, cds and trailer separately. This tables are stored as SummarizedExperiment, for easy loading into DEseq, conversion to normalized fpkm values, or collapsing replicates in an experiment. And can be imported with countTable function.

Everything will be outputed in the directory of your NGS data, inside the folder ./QC_STATS/, relative to data location in 'df'. You can specify new out location with out.dir if you want.
To make a ORFik experiment, see ?ORFik::experiment
To see some normal mrna coverage profiles of different RNA-seq protocols: https://www.ncbi.nlm.nih.gov/pmc/articles/P

Usage

```
QCreport(df, out.dir = dirname(df$filepath[1]), BPPARAM = bpparam())
```

Arguments

df	an ORFik experiment
out.dir	optional output directory, default: dirname(df$filepath[1]). Will make a folder called "QC_STATS" with all results in this directory.
BPPARAM	how many cores/threads to use? default: bpparam(). To see number of threads used, do bpparam()$workers

Value

invisible(NULL) (objects are stored to disc)

See Also

Other QC report: QCplots(), QCstats()

Examples

```
# Load an experiment
df <- ORFik.template.experiment()
# Run QC
# QCreport(df)
```

QCstats *Load ORFik QC Statistics report*

Description

Loads the pre / post alignment statistcs made in ORFik.

Usage

```
QCstats(df, path = file.path(dirname(df$filepath[1]), "/QC_STATS/STATS.csv"))
```

Arguments

df	an ORFik experiment
path	path to QC statistics report, default: file.path(dirname(df$filepath[1]), "/QC_STATS/STATS.csv")

Details

The ORFik QC uses the aligned files (usually bam files), fastp and STAR log files combined with annotation to create relevant statistics.

Value

data.table of QC report or NULL if not exists

See Also

Other QC report: `QCplots()`, `QCreport()`

Examples

```
df <- ORFik.template.experiment()[3,]
## First make QC report
# QCreport(df)
# stats <- QCstats(df)
```

QCstats.plot *Make plot of ORFik QCreport*

Description

From post-alignment QC relative to annotation, make a plot for all samples. Will contain among others read lengths, reads overlapping leaders, cds, trailers, mRNA / rRNA etc.

Usage

```
QCstats.plot(stats, output.dir = NULL)
```

Arguments

`stats`	path to ORFik QC stats .csv file, or the experiment object.
`output.dir`	NULL or character path, default: NULL, plot not saved to disc. If defined saves plot to that directory with the name "/STATS_plot.png".

Value

ggplot object of the the statistics data

Examples

```
df <- ORFik.template.experiment()[3,]
## First make QC report
# QCreport(df)
## Now you can get plot
# QCstats.plot(df)
```

QC_count_tables *Create count table info for QC report*

Description

The better the annotation / gtf used, the more results you get.

Usage

```
QC_count_tables(df, out.dir, type = "ofst", BPPARAM = bpparam())
```

Arguments

df	an ORFik experiment
out.dir	optional output directory, default: dirname(df$filepath[1]). Will make a folder called "QC_STATS" with all results in this directory.
type	a character(default: "default"), load files in experiment or some precomputed variant, either "ofst", "bedo", "bedoc" or "pshifted". These are made with ORFik:::convertLibs() or shiftFootprintsByExperiment(). Can also be custom user made folders inside the experiments bam folder.
BPPARAM	how many cores/threads to use? default: bpparam(). To see number of threads used, do bpparam()$workers

Value

a data.table of the count info

rankOrder *ORF rank in transcripts*

Description

Creates an ordering of ORFs per transcript, so that ORF with the most upstream start codon is 1, second most upstream start codon is 2, etc. Must input a grl made from ORFik, txNames_2 -> 2.

Usage

```
rankOrder(grl)
```

Arguments

grl	a GRangesList object with ORFs

Value

a numeric vector of integers

References

doi: 10.1074/jbc.R116.733899

See Also

Other features: computeFeaturesCage(), computeFeatures(), countOverlapsW(), disengagementScore(), distToCds(), distToTSS(), entropy(), floss(), fpkm_calc(), fpkm(), fractionLength(), initiationScore(), insideOutsideORF(), isInFrame(), isOverlapping(), kozakSequenceScore(), orfScore(), ribosomeReleaseScore(), ribosomeStallingScore(), startRegionCoverage(), startRegion(), stopRegion(), subsetCoverage(), translationalEff()

Examples

```
gr_plus <- GRanges(seqnames = c("chr1", "chr1"),
                   ranges = IRanges(c(7, 14), width = 3),
                   strand = c("+", "+"))
gr_minus <- GRanges(seqnames = c("chr2", "chr2"),
                    ranges = IRanges(c(4, 1), c(9, 3)),
                    strand = c("-", "-"))
grl <- GRangesList(tx1 = gr_plus, tx2 = gr_minus)
grl <- ORFik:::makeORFNames(grl)
rankOrder(grl)
```

---

read.experiment *Read ORFik experiment*

Description

Read in runs / samples from an experiment as a single R object. To read an ORFik experiment, you must of course make one first. See create.experiment The file must be csv and be a valid ORFik experiment

Usage

```
read.experiment(file, in.dir = "~/Bio_data/ORFik_experiments/")
```

Arguments

file	relative path to a ORFik experiment. That is a .csv file following ORFik experiment style ("," as seperator). , or a template data.frame from create.experiment. Can also be full path to file, then in.dir argument is ignored.
in.dir	Directory to load experiment csv file from, default: "~/Bio_data/ORFik_experiments/" Set to NULL if you don't want to save it to disc. Does not apply if file is not a path, but a data.frame. Also does not apply if file was given as full path.

Value

an ORFik experiment

See Also

Other ORFik_experiment: ORFik.template.experiment(), bamVarName(), create.experiment(), experiment-class, filepath(), libraryTypes(), organism.df(), outputLibs(), save.experiment(), validateExperiments()

Examples

```
# From file
## Not run:
# Read from file
df <- read.experiment(filepath) # <- valid ORFik .csv file

## End(Not run)
## Read from (create.experiment() template)
df <- ORFik.template.experiment()

## To save it, do:
# save.experiment(df, file = "path/to/save/experiment")
## You can then do:
# read.experiment("path/to/save/experiment")
# or (identical):
# read.experiment("experiment", in.dir = "path/to/save/")
```

`readBam` *Custom bam reader*

Description

Read in Bam file from either single end or paired end. Safer combined version of `readGAlignments` and readGAlignmentPairs that takes care of some common errors.
If QNAMES of the aligned reads are from collapsed fasta files (if the names are formated from collapsing in either (ORFik, ribotoolkit or fastx)), the bam file will contain a meta column called collapsed with the counts of duplicates per read.

Usage

```
readBam(path, chrStyle = NULL, param = NULL, strandMode = 0)
```

Arguments

`path`	a character / data.table with path to .bam file. There are 3 input file possibilities. • single end : a character path (length 1) • paired end (1 file) : Either a character path (length of 2), where path[2] is "paired-end", or a data.table with 2 columns, forward = path & reverse = "paired-end" • paired end (2 files) : Either a character path (length of 2), where path[2] is path to R2, or a data.table with 2 columns, forward = path to R1 & reverse = path to R2. (This one is not used often)
`chrStyle`	a GRanges object, TxDb, FaFile, or a `seqlevelsStyle` (Default: NULL) to get seqlevelsStyle from. Is chromosome 1 called chr1 or 1, is mitocondrial chromosome called MT or chrM etc. Will use 1st seqlevel-style if more are present. Like: c("NCBI", "UCSC") -> pick "NCBI"
`param`	`NULL` or a ScanBamParam object. Like for `scanBam`, this influences what fields and which records are imported. However, note that the fields specified thru this ScanBamParam object will be loaded *in addition* to any field required for generating the returned object (GAlignments, GAlignmentPairs, or GappedReads

	object), but only the fields requested by the user will actually be kept as metadata columns of the object. By default (i.e. `param=NULL` or `param=ScanBamParam()`), no additional field is loaded. The flag used is `scanBamFlag(isUnmappedQuery=FALSE)` for `readGAlignments`, `readGAlignmentsList`, and `readGappedReads`. (i.e. only records corresponding to mapped reads are loaded), and `scanBamFlag(isUnmappedQuery=FALSE,isPaired=TRUE,has` for `readGAlignmentPairs` (i.e. only records corresponding to paired-end reads with both ends mapped are loaded).
`strandMode`	numeric, default 0. Only used for paired end bam files. One of (0: strand = *, 1: first read of pair is +, 2: first read of pair is -). See ?strandMode. Note: Sets default to 0 instead of 1, as readGAlignmentPairs uses 1. This is to guarantee hits, but will also make mismatches of overlapping transcripts in opposite directions.

Details

In the future will use a faster .bam loader for big .bam files in R.

Value

a `GAlignments` or `GAlignmentPairs` object of bam file

See Also

Other utils: `bedToGR()`, `convertToOneBasedRanges()`, `export.bed12()`, `export.wiggle()`, `fimport()`, `findFa()`, `fread.bed()`, `optimizeReads()`, `readWig()`

Examples

```
bam_file <- system.file("extdata", "ribo-seq.bam", package = "ORFik")
readBam(bam_file, "UCSC")
```

---

readLengthTable *Make table of readlengths*

Description

Summarizing all libraries in experiment, make a table of proportion of read lengths.

Usage

```
readLengthTable(df, output.dir = NULL, type = "ofst", BPPARAM = bpparam())
```

Arguments

`df`	an ORFik `experiment`
`output.dir`	NULL or character path, default: NULL, plot not saved to disc. If defined saves plot to that directory with the name "./readLengths.csv".
`type`	character, default: "ofst". Type of library: either "default", usually bam format (the one you gave to experiment), "pshifted" pshifted reads, "ofst", "bed", "bedo" optimized bed, or "wig"
`BPPARAM`	how many cores/threads to use? default: bpparam(). To see number of threads used, do `bpparam()$workers`

Value

a data.table object of the the read length data with columns: c("sample","sample_id","read length","counts","counts_per_sample","perc_of_counts_per_sample")

`readWidths` *Get read widths*

Description

Input any reads, e.g. ribo-seq object and get width of reads, this is to avoid confusion between width, qwidth and meta column containing original read width.

Usage

```
readWidths(reads, after.softclips = TRUE, along.reference = FALSE)
```

Arguments

`reads`	a GRanges, GAlignment or GAlignmentPairs object.
`after.softclips`	logical (TRUE), include softclips in width. Does not apply if along.reference is TRUE.
`along.reference`	logical (FALSE), example: The cigar "26MI2" is by default width 28, but if along.reference is TRUE, it will be 26. The length of the read along the reference. Also "1D20M" will be 21 if by along.reference is TRUE. Intronic regions (cigar: N) will be removed. So: "1M200N19M" is 20, not 220.

Details

If input is p-shifted and GRanges, the "$size" or "$score" colum" must exist, and the column must contain the original read widths. In ORFik "$size" have higher priority than "$score" for defining length. ORFik P-shifting creates a $size column, other softwares like shoelaces creates a score column.

Remember to think about how you define length. Like the question: is a Illumina error mismatch sufficient to reduce size of read and how do you know what is biological variance and what are Illumina errors?

Value

an integer vector of widths

Examples

```
gr <- GRanges("chr1", 1)
readWidths(gr)

# GAlignment with hit (1M) and soft clipped base (1S)
ga <- GAlignments(seqnames = "1", pos = as.integer(1), cigar = "1M1S",
 strand = factor("+", levels = c("+", "-", "*")))
readWidths(ga) # Without soft-clip bases
```

```
readWidths(ga, after.softclips = FALSE) # With soft-clip bases
```

`readWig` *Custom wig reader*

Description

Given 2 wig files, first is forward second is reverse. Merge them and return as GRanges object. If they contain name reverse and forward, first and second order does not matter, it will search for forward and reverse.

Usage

```
readWig(path, chrStyle = NULL)
```

Arguments

`path`	a character path to two .wig files, or a data.table with 2 columns, (forward, filepath) and reverse, only 1 row.
`chrStyle`	a GRanges object, TxDb, FaFile, or a `seqlevelsStyle` (Default: NULL) to get seqlevelsStyle from. Is chromosome 1 called chr1 or 1, is mitocondrial chromosome called MT or chrM etc. Will use 1st seqlevel-style if more are present. Like: c("NCBI", "UCSC") -> pick "NCBI"

Value

a `GRanges` object of the file/s

See Also

Other utils: `bedToGR()`, `convertToOneBasedRanges()`, `export.bed12()`, `export.wiggle()`, `fimport()`, `findFa()`, `fread.bed()`, `optimizeReads()`, `readBam()`

`reassignTSSbyCage` *Reassign all Transcript Start Sites (TSS)*

Description

Given a GRangesList of 5' UTRs or transcripts, reassign the start sites using max peaks from CageSeq data. A max peak is defined as new TSS if it is within boundary of 5' leader range, specified by 'extension' in bp. A max peak must also be higher than minimum CageSeq peak cutoff specified in 'filterValue'. The new TSS will then be the positioned where the cage read (with highest read count in the interval). If removeUnused is TRUE, leaders without cage hits, will be removed, if FALSE the original TSS will be used.

Usage

```
reassignTSSbyCage(
  fiveUTRs,
  cage,
  extension = 1000,
  filterValue = 1,
  restrictUpstreamToTx = FALSE,
  removeUnused = FALSE,
  preCleanup = TRUE,
  cageMcol = FALSE
)
```

Arguments

fiveUTRs	(GRangesList) The 5' leaders or full transcript sequences
cage	Either a filePath for the CageSeq file as .bed .bam or .wig, with possible compressions (".gzip", ".gz", ".bgz"), or already loaded CageSeq peak data as GRanges or GAlignment. NOTE: If it is a .bam file, it will add a score column by running: convertToOneBasedRanges(cage, method = "5prime", addScoreColumn = TRUE) The score column is then number of replicates of read, if score column is something else, like read length, set the score column to NULL first.
extension	The maximum number of basses upstream of the TSS to search for CageSeq peak.
filterValue	The minimum number of reads on cage position, for it to be counted as possible new tss. (represented in score column in CageSeq data) If you already filtered, set it to 0.
restrictUpstreamToTx	a logical (FALSE). If TRUE: restrict leaders to not extend closer than 5 bases from closest upstream leader, set this to TRUE.
removeUnused	logical (FALSE), if False: (standard is to set them to original annotation), If TRUE: remove leaders that did not have any cage support.
preCleanup	logical (TRUE), if TRUE, remove all reads in region (-5:-1, 1:5) of all original tss in leaders. This is to keep original TSS if it is only +/- 5 bases from the original.
cageMcol	a logical (FALSE), if TRUE, add a meta column to the returned object with the raw CAGE counts in support for new TSS.

Details

Note: If you used CAGEr, you will get reads of a probability region, with always score of 1. Remember then to set filterValue to 0. And you should use the 5' end of the read as input, use: ORFik:::convertToOneBasedRanges(cage) NOTE on filtervalue: To get high quality TSS, set filtervalue to median count of reads overlapping per leader. This will make you discard a lot of new TSS positions though. I usually use 10 as a good standard.

TIP: do summary(countOverlaps(fiveUTRs, cage)) so you can find a good cutoff value for noise.

Value

a GRangesList of newly assigned TSS for fiveUTRs, using CageSeq data.

See Also

Other CAGE: assignTSSByCage(), reassignTxDbByCage()

Examples

```
# example 5' leader, notice exon_rank column
fiveUTRs <- GenomicRanges::GRangesList(
  GenomicRanges::GRanges(seqnames = "chr1",
                         ranges = IRanges::IRanges(1000, 2000),
                         strand = "+",
                         exon_rank = 1))
names(fiveUTRs) <- "tx1"

# make fake CageSeq data from promoter of 5' leaders, notice score column
cage <- GenomicRanges::GRanges(
  seqnames = "1",
  ranges =  IRanges::IRanges(500, width = 1),
  strand = "+",
  score = 10) # <- Number of tags (reads) per position
# notice also that seqnames use different naming, this is fixed by ORFik
# finally reassign TSS for fiveUTRs
reassignTSSbyCage(fiveUTRs, cage)
# See vignette for example using gtf file and real CAGE data.
```

---

reassignTxDbByCage *Input a txdb and reassign the TSS for each transcript by CAGE*

Description

Given a TxDb object, reassign the start site per transcript using max peaks from CageSeq data. A max peak is defined as new TSS if it is within boundary of 5' leader range, specified by 'extension' in bp. A max peak must also be higher than minimum CageSeq peak cutoff specified in 'filterValue'. The new TSS will then be the positioned where the cage read (with highest read count in the interval).

Usage

```
reassignTxDbByCage(
  txdb,
  cage,
  extension = 1000,
  filterValue = 1,
  restrictUpstreamToTx = FALSE,
  removeUnused = FALSE,
  preCleanup = TRUE
)
```

Arguments

txdb	a TxDb file, a path to one of: (.gtf ,.gff, .gff2, .gff2, .db or .sqlite) or an ORFik experiment

cage — Either a filePath for the CageSeq file as .bed .bam or .wig, with possible compressions (".gzip", ".gz", ".bgz"), or already loaded CageSeq peak data as GRanges or GAlignment. NOTE: If it is a .bam file, it will add a score column by running: convertToOneBasedRanges(cage, method = "5prime", addScoreColumn = TRUE) The score column is then number of replicates of read, if score column is something else, like read length, set the score column to NULL first.

extension — The maximum number of basses upstream of the TSS to search for CageSeq peak.

filterValue — The minimum number of reads on cage position, for it to be counted as possible new tss. (represented in score column in CageSeq data) If you already filtered, set it to 0.

restrictUpstreamToTx — a logical (FALSE). If TRUE: restrict leaders to not extend closer than 5 bases from closest upstream leader, set this to TRUE.

removeUnused — logical (FALSE), if False: (standard is to set them to original annotation), If TRUE: remove leaders that did not have any cage support.

preCleanup — logical (TRUE), if TRUE, remove all reads in region (-5:-1, 1:5) of all original tss in leaders. This is to keep original TSS if it is only +/- 5 bases from the original.

Details

Note: If you used CAGEr, you will get reads of a probability region, with always score of 1. Remember then to set filterValue to 0. And you should use the 5' end of the read as input, use: ORFik:::convertToOneBasedRanges(cage)

Value

a TxDb obect of reassigned transcripts

See Also

Other CAGE: assignTSSByCage(), reassignTSSbyCage()

Examples

```
## Not run:
library(GenomicFeatures)
# Get the gtf txdb file
txdbFile <- system.file("extdata", "hg19_knownGene_sample.sqlite",
package = "GenomicFeatures")
cagePath <- system.file("extdata", "cage-seq-heart.bed.bgz",
package = "ORFik")
reassignTxDbByCage(txdbFile, cagePath)

## End(Not run)
```

`reduceKeepAttr` *Reduce GRanges / GRangesList*

Description

Reduce away all GRanges elements with 0-width.

Usage

```
reduceKeepAttr(
  grl,
  keep.names = FALSE,
  drop.empty.ranges = FALSE,
  min.gapwidth = 1L,
  with.revmap = FALSE,
  with.inframe.attrib = FALSE,
  ignore.strand = FALSE,
  min.strand.decreasing = TRUE
)
```

Arguments

`grl`	a `GRangesList` or GRanges object
`keep.names`	(FALSE) keep the names and meta columns of the GRangesList
`drop.empty.ranges`	(FALSE) if a group is empty (width 0), delete it.
`min.gapwidth`	(1L) how long gap can it be between two ranges, to merge them.
`with.revmap`	(FALSE) return info on which mapped to which
`with.inframe.attrib`	(FALSE) For internal use.
`ignore.strand`	(FALSE), can different strands be reduced together.
`min.strand.decreasing`	(TRUE), if GRangesList, return minus strand group ranges in decreasing order (1-5, 30-50) -> (30-50, 1-5)

Details

Extends function `reduce` by trying to keep names and meta columns, if it is a GRangesList. It also does not lose sorting for GRangesList, since original reduce sorts all by ascending position. If keep.names == FALSE, it's just the normal GenomicRanges::reduce with sorting negative strands descending for GRangesList.

Value

A reduced GRangesList

See Also

Other ExtendGenomicRanges: `asTX()`, `coveragePerTiling()`, `extendLeaders()`, `extendTrailers()`, `tile1()`, `txSeqsFromFa()`, `windowPerGroup()`

Examples

```
ORF <- GRanges(seqnames = "1",
               ranges = IRanges(start = c(1, 2, 3), end = c(1, 2, 3)),
               strand = "+")
# For GRanges
reduceKeepAttr(ORF, keep.names = TRUE)
# For GRangesList
grl <- GRangesList(tx1_1 = ORF)
reduceKeepAttr(grl, keep.names = TRUE)
```

---

regionPerReadLength *Find proportion of reads per position per read length in region*

Description

This is defined as: Given some transcript region (like CDS), get coverage per position.

Usage

```
regionPerReadLength(
  grl,
  reads,
  acceptedLengths = NULL,
  withFrames = TRUE,
  scoring = "transcriptNormalized",
  weight = "score",
  BPPARAM = bpparam()
)
```

Arguments

grl	a GRangesList object with usually either leaders, cds', 3' utrs or ORFs
reads	a GAlignments or GRanges object of RiboSeq, RnaSeq etc. Weigths for scoring is default the 'score' column in 'reads'
acceptedLengths	an integer vector (NULL), the read lengths accepted. Default NULL, means all lengths accepted.
withFrames	logical TRUE, add ORF frame (frame 0, 1, 2), starting on first position of every grl.
scoring	a character (transcriptNormalized), which meta coverage scoring ? one of (zscore, transcriptNormalized, mean, median, sum, sumLength, fracPos), see ?coverageScorings for more info. Use to decide a scoring of hits per position for metacoverage etc. Set to NULL if you do not want meta coverage, but instead want per gene per position raw counts.
weight	(default: 'score'), if defined a character name of valid meta column in subject. GRanges("chr1", 1, "+", score = 5), would mean score column tells that this alignment region was found 5 times. ORFik .bedo files, contains a score column like this. As do CAGEr CAGE files and many other package formats. You can also assign a score column manually.
BPPARAM	how many cores/threads to use? default: bpparam()

Value

a data.table with lengths by coverage.

See Also

Other coverage: `coverageScorings()`, `metaWindow()`, `scaledWindowPositions()`, `windowPerReadLength()`

Examples

```
# Raw counts per gene per position
cds <- GRangesList(tx1 = GRanges("1", 100:129, "+"))
reads <- GRanges("1", seq(79,129, 3), "+")
reads$size <- 28 # <- Set read length of reads
regionPerReadLength(cds, reads, scoring = NULL)
## Sum up reads in each frame per read length per gene
regionPerReadLength(cds, reads, scoring = "frameSumPerLG")
```

---

remakeTxdbExonIds *Get new exon ids after update of txdb*

Description

Get new exon ids after update of txdb

Usage

```
remakeTxdbExonIds(txList)
```

Arguments

txList	a list, call of as.list(txdb)

Value

a new valid ordered list of exon ids (integer)

---

remove.experiments *Remove bam/bed/wig files load in R as variables*

Description

Variable names defined by df, in envir defined

Usage

```
remove.experiments(df, envir = .GlobalEnv)
```

Arguments

df	an ORFik `experiment`
envir	environment to save to, default (.GlobalEnv)

Value

NULL (objects removed from envir specified)

Examples

```
df <- ORFik.template.experiment()
# Output to .GlobalEnv with:
# outputLibs(df)
# Then remove them with:
# remove.experiments(df)
```

---

remove.file_ext *Remove file extension of path*

Description

Allows removal of compression

Usage

```
remove.file_ext(path, basename = FALSE)
```

Arguments

path	character path (allows multiple paths)
basename	relative path (TRUE) or full path (FALSE)? (default: FALSE)

Value

character path without file extension

---

removeMetaCols *Removes meta columns*

Description

Removes meta columns

Usage

```
removeMetaCols(grl)
```

Arguments

grl	a GRangesList or GRanges object

Value

same type and structure as input without meta columns

removeORFsWithinCDS *Remove ORFs that are within cds*

Description

Remove ORFs that are within cds

Usage

```
removeORFsWithinCDS(grl, cds)
```

Arguments

grl	(GRangesList), the ORFs to filter
cds	(GRangesList), the coding sequences (main ORFs on transcripts), to filter against.

Value

(GRangesList) of filtered uORFs

See Also

Other uorfs: addCdsOnLeaderEnds(), filterUORFs(), removeORFsWithSameStartAsCDS(), removeORFsWithSameSt
removeORFsWithStartInsideCDS(), uORFSearchSpace()

removeORFsWithSameStartAsCDS *Remove ORFs that have same start site as the CDS*

Description

Remove ORFs that have same start site as the CDS

Usage

```
removeORFsWithSameStartAsCDS(grl, cds)
```

Arguments

grl	(GRangesList), the ORFs to filter
cds	(GRangesList), the coding sequences (main ORFs on transcripts), to filter against.

Value

(GRangesList) of filtered uORFs

See Also

Other uorfs: addCdsOnLeaderEnds(), filterUORFs(), removeORFsWithSameStopAsCDS(), removeORFsWithStartIn
removeORFsWithinCDS(), uORFSearchSpace()

`removeORFsWithSameStopAsCDS` *Remove ORFs that have same stop site as the CDS*

Description

Remove ORFs that have same stop site as the CDS

Usage

```
removeORFsWithSameStopAsCDS(grl, cds)
```

Arguments

`grl`	(GRangesList), the ORFs to filter
`cds`	(GRangesList), the coding sequences (main ORFs on transcripts), to filter against.

Value

(GRangesList) of filtered uORFs

See Also

Other uorfs: `addCdsOnLeaderEnds()`, `filterUORFs()`, `removeORFsWithSameStartAsCDS()`, `removeORFsWithStartI`
`removeORFsWithinCDS()`, `uORFSearchSpace()`

`removeORFsWithStartInsideCDS` *Remove ORFs that have start site within the CDS*

Description

Remove ORFs that have start site within the CDS

Usage

```
removeORFsWithStartInsideCDS(grl, cds)
```

Arguments

`grl`	(GRangesList), the ORFs to filter
`cds`	(GRangesList), the coding sequences (main ORFs on transcripts), to filter against.

Value

(GRangesList) of filtered uORFs

See Also

Other uorfs: `addCdsOnLeaderEnds()`, `filterUORFs()`, `removeORFsWithSameStartAsCDS()`, `removeORFsWithSameSt`
`removeORFsWithinCDS()`, `uORFSearchSpace()`

removeTxdbExons *Remove exons in txList that are not in fiveUTRs*

Description

Remove exons in txList that are not in fiveUTRs

Usage

```
removeTxdbExons(txList, fiveUTRs)
```

Arguments

txList	a list, call of as.list(txdb)
fiveUTRs	a GRangesList of 5' leaders

Value

a list, modified call of as.list(txdb)

removeTxdbTranscripts *Remove specific transcripts in txdb List*

Description

Remove all transcripts, except the ones in fiveUTRs.

Usage

```
removeTxdbTranscripts(txList, fiveUTRs)
```

Arguments

txList	a list, call of as.list(txdb)
fiveUTRs	a GRangesList of 5' leaders

Value

a txList

rename.SRA.files *Rename SRA files from metadata*

Description

Rename SRA files from metadata

Usage

```
rename.SRA.files(files, new_names)
```

Arguments

files	a character vector, with full path to all the files
new_names	a character vector of new names or a data.table with metadata to use to rename (usually from SRA metadata). Priority of renaming from the metadata is to check for unique names in the LibraryName column, then the sample_title column if no valid names in LibraryName. If found and still duplicates, will add "_rep1", "_rep2" to make them unique. Paired end data will get a extension of _p1 and _p2. If no valid names, will not rename, that is keep the SRR numbers, you then can manually rename files to something more meaningful.

Value

a character vector of new file names

See Also

Other sra: `download.SRA.metadata()`, `download.SRA()`, `download.ebi()`, `install.sratoolkit()`

repNames *Get replicate name variants*

Description

Used to standardize nomeclature for experiments.
Example: 1 is main naming, but a variant is rep1 rep1 will then be renamed to 1

Usage

```
repNames()
```

Value

a data.table with 2 columns, the main name, and all name variants of the main name in second column as a list.

See Also

Other experiment_naming: `cellLineNames()`, `conditionNames()`, `libNames()`, `mainNames()`, `stageNames()`, `tissueNames()`

`restrictTSSByUpstreamLeader` *Restrict extension of 5' UTRs to closest upstream leader end*

Description

Basicly this function restricts all startSites, to the upstream GRangesList objects end. Usually leaders, for CAGE. Example: leader1: start on 10, leader2: stop on 8, extend leader1 to 5 -> this function will resize leader1 to 9, to be outside leader2, so that CAGE reads can not wrongly overlap.

Usage

```
restrictTSSByUpstreamLeader(fiveUTRs, shiftedfiveUTRs)
```

Arguments

`fiveUTRs`	The 5' leader sequences as GRangesList
`shiftedfiveUTRs`	The 5' leader sequences as GRangesList shifted by CAGE

Value

GRangesList object of restricted fiveUTRs

`reverseMinusStrandPerGroup` *Reverse minus strand*

Description

Reverse minus strand per group in a GRangesList Only reverse if minus strand is in increasing order

Usage

```
reverseMinusStrandPerGroup(grl, onlyIfIncreasing = TRUE)
```

Arguments

`grl`	a GRangesList
`onlyIfIncreasing`	logical, default (TRUE), only reverse if decreasing

Value

a GRangesList

RiboQC.plot *Quality control for pshifted Ribo-seq data*

Description

Quality control for pshifted Ribo-seq data

Usage

```
RiboQC.plot(
  df,
  output.dir = file.path(dirname(df$filepath[1]), "QC_STATS/"),
  width = 6.6,
  height = 4.5,
  type = "pshifted",
  weight = "score",
  BPPARAM = BiocParallel::SerialParam(progressbar = TRUE)
)
```

Arguments

df	an ORFik experiment
output.dir	directory to save plot, default: file.path(dirname(df$filepath[1]), "QC_STATS/"). If NULL will not save.
width	width of plot, default 6.6 (in inches)
height	height of plot, default 4.5 (in inches)
type	type of library loaded, default pshifted, warning if not pshifted might crash if too many read lengths!
weight	which column in reads describe duplicates, default "score".
BPPARAM	how many cores/threads to use? default: bpparam(). To see number of threads used, do bpparam()$workers

Value

ggplot object as a grid

Examples

```
df <- ORFik.template.experiment()
df <- df[3,] #lets only p-shift RFP sample at index 3
#shiftFootprintsByExperiment(df)
#RiboQC.plot(df)
```

`ribosomeReleaseScore` *Ribosome Release Score (RRS)*

Description

Ribosome Release Score is defined as

```
(RPFs over ORF)/(RPFs over 3' utrs)
```

and additionaly normalized by lengths. If RNA is added as argument, it will normalize by RNA counts to justify location of 3' utrs. It can be understood as a ribosome stalling feature. A pseudo-count of one was added to both the ORF and downstream sums.

Usage

```
ribosomeReleaseScore(
  grl,
  RFP,
  GtfOrThreeUtrs,
  RNA = NULL,
  weight.RFP = 1L,
  weight.RNA = 1L,
  overlapGrl = NULL
)
```

Arguments

`grl`	a `GRangesList` object with usually either leaders, cds', 3' utrs or ORFs.
`RFP`	RiboSeq reads as GAlignments, GRanges or GRangesList object
`GtfOrThreeUtrs`	if Gtf: a TxDb object of a gtf file transcripts is called from: 'threeUTRsByTranscript(Gtf, use.names = TRUE)', if object is GRangesList, it is presumed to be the 3' utrs
`RNA`	RnaSeq reads as `GAlignments`, `GRanges` or GRangesList object
`weight.RFP`	a vector (default: 1L). Can also be character name of column in RFP. As in translationalEff(weight = "score") for: GRanges("chr1", 1, "+", score = 5), would mean score column tells that this alignment region was found 5 times.
`weight.RNA`	Same as weightRFP but for RNA weights. (default: 1L)
`overlapGrl`	an integer, (default: NULL), if defined must be countOverlaps(grl, RFP), added for speed if you already have it

Value

a named vector of numeric values of scores, NA means that no 3' utr was found for that transcript.

References

doi: 10.1016/j.cell.2013.06.009

See Also

Other features: computeFeaturesCage(), computeFeatures(), countOverlapsW(), disengagementScore(), distToCds(), distToTSS(), entropy(), floss(), fpkm_calc(), fpkm(), fractionLength(), initiationScore(), insideOutsideORF(), isInFrame(), isOverlapping(), kozakSequenceScore(), orfScore(), rankOrder(), ribosomeStallingScore(), startRegionCoverage(), startRegion(), stopRegion(), subsetCoverage(), translationalEff()

Examples

```
ORF <- GRanges(seqnames = "1",
               ranges = IRanges(start = c(1, 10, 20), end = c(5, 15, 25)),
               strand = "+")
grl <- GRangesList(tx1_1 = ORF)
threeUTRs <- GRangesList(tx1 = GRanges("1", IRanges(40, 50), "+"))
RFP <- GRanges("1", IRanges(25, 25), "+")
RNA <- GRanges("1", IRanges(1, 50), "+")
ribosomeReleaseScore(grl, RFP, threeUTRs, RNA)
```

---

ribosomeStallingScore *Ribosome Stalling Score (RSS)*

Description

Is defined as

```
(RPFs over ORF stop sites)/(RPFs over ORFs)
```

and normalized by lengths A pseudo-count of one was added to both the ORF and downstream sums.

Usage

```
ribosomeStallingScore(grl, RFP, weight = 1L, overlapGrl = NULL)
```

Arguments

grl	a GRangesList object with usually either leaders, cds', 3' utrs or ORFs.
RFP	RiboSeq reads as GAlignments, GRanges or GRangesList object
weight	a vector (default: 1L, if 1L it is identical to countOverlaps()), if single number (!= 1), it applies for all, if more than one must be equal size of 'reads'. else it must be the string name of a defined meta column in subject "reads", that gives number of times a read was found. GRanges("chr1", 1, "+", score = 5), would mean "score" column tells that this alignment region was found 5 times.
overlapGrl	an integer, (default: NULL), if defined must be countOverlaps(grl, RFP), added for speed if you already have it

Value

a named vector of numeric values of RSS scores

References

doi: 10.1016/j.cels.2017.08.004

```
ORF <- GRanges(seqnames = "1",
               ranges = IRanges(start = c(1, 10, 20), end = c(5, 15, 25)),
               strand = "+")
grl <- GRangesList(tx1_1 = ORF)
RFP <- GRanges("1", IRanges(25, 25), "+")
ribosomeStallingScore(grl, RFP)
```

---

rnaNormalize *Normalize a data.table of coverage by RNA seq per position*

Description

Normalizes per position per gene by this function: (reads at position / min(librarysize, 1) * number of genes) / fpkm of that gene's RNA-seq

Usage

```
rnaNormalize(coverage, df, dfr = NULL, tx, normalizeMode = "position")
```

Arguments

coverage	a data.table containing at least columns (count/score, position), it is possible to have additionals: (genes, fraction, feature)
df	an ORFik experiment
dfr	an ORFik experiment of RNA-seq to normalize against. Will add RNA normalized to plot name if this is done.
tx	a GRangesList of mrna transcripts
normalizeMode	a character (default: "position"), how to normalize library against rna library. Either on "position", normalize by number of genes, sum of reads and RNA seq, on tx "region" or "feature": same as position but RNA is split into the feature groups to normalize. Useful if you have a list of targets and background genes.

Details

Good way to compare libraries

Value

a data.table of normalized transcripts by RNA.

---

save.experiment *Save* experiment *to disc*

Description

Save experiment to disc

Usage

```
save.experiment(df, file)
```

Arguments

df	an ORFik experiment
file	name of file to save df as

Value

NULL (experiment save only)

See Also

Other ORFik_experiment: ORFik.template.experiment(), bamVarName(), create.experiment(), experiment-class, filepath(), libraryTypes(), organism.df(), outputLibs(), read.experiment(), validateExperiments()

Examples

```
df <- ORFik.template.experiment()
## Save with:
#save.experiment(df, file = "path/to/save/experiment.csv")
## Identical (.csv not needed, can be added):
#save.experiment(df, file = "path/to/save/experiment")
```

---

savePlot *Helper function for writing plots to disc*

Description

Helper function for writing plots to disc

Usage

```
savePlot(plot, output = NULL, width = 200, height = 150, dpi = 300)
```

Arguments

plot	the ggplot to save
output	character string (NULL), if set, saves the plot as pdf or png to path given. If no format is given, is save as png.
width	width of output in mm
height	height of output in mm
dpi	(300) dpi of plot

Value

a ggplot object of the coverage plot, NULL if output is set, then the plot will only be saved to location.

See Also

Other coveragePlot: `coverageHeatMap()`, `pSitePlot()`, `windowCoveragePlot()`

---

scaledWindowPositions *Scale (bin) windows to a meta window of given size*

Description

For example scale a coverage table of a all human CDS to width 100

Usage

```
scaledWindowPositions(
  grl,
  reads,
  scaleTo = 100,
  scoring = "meanPos",
  weight = "score",
  is.sorted = FALSE
)
```

Arguments

grl	GRangesList or GRanges of your ranges
reads	GRanges object of your reads.
scaleTo	an integer (100), if windows have different size, a meta window can not directly be created, since a meta window must have equal size for all windows. Rescale all windows to scaleTo. i.e c(1,2,3) -> size 2 -> c(1, mean(2,3)) etc. Can also be a vector, 1 number per grl group.
scoring	a character, one of (meanPos, sumPos)
weight	(default: 'score'), if defined a character name of valid meta column in subject. GRanges("chr1", 1, "+", score = 5), would mean score column tells that this alignment region was found 5 times. ORFik .bedo files, contains a score column like this. As do CAGEr CAGE files and many other package formats. You can also assign a score column manually.
is.sorted	logical (FALSE), is grl sorted. That is + strand groups in increasing ranges (1,2,3), and - strand groups in decreasing ranges (3,2,1)

Details

Nice for making metaplots, the score will be mean of merged positions.

Value

A data.table with scored counts (counts) of reads mapped to positions (position) specified in windows along with frame (frame).

See Also

Other coverage: `coverageScorings()`, `metaWindow()`, `regionPerReadLength()`, `windowPerReadLength()`

Examples

```
library(GenomicRanges)
windows <- GRangesList(GRanges("chr1", IRanges(1, 200), "-"))
x <- GenomicRanges::GRanges(
  seqnames = "chr1",
  ranges =  IRanges::IRanges(c(1, 100, 199), c(2, 101, 200)),
  strand = "-")
scaledWindowPositions(windows, x, scaleTo = 100)
```

---

scoreSummarizedExperiment

Helper function for makeSummarizedExperimentFromBam

Description

If txdb or gtf path is added, it is a rangedSummerizedExperiment For FPKM values, DESeq2::fpkm(robust = FALSE) is used

Usage

```
scoreSummarizedExperiment(
  final,
  score = "transcriptNormalized",
  collapse = FALSE
)
```

Arguments

`final`	ranged summarized experiment object
`score`	default: "transcriptNormalized" (row normalized raw counts matrix), alternative is "fpkm", "log2fpkm" or "log10fpkm"
`collapse`	a logical/character (default FALSE), if TRUE all samples within the group SAMPLE will be collapsed to one. If "all", all groups will be merged into 1 column called merged_all. Collapse is defined as rowSum(elements_per_group) / ncol(elements_per_group)

Value

a DEseq summerizedExperiment object (transcriptNormalized) or matrix (if fpkm input)

seqnamesPerGroup *Get list of seqnames per granges group*

Description

Get list of seqnames per granges group

Usage

```
seqnamesPerGroup(grl, keep.names = TRUE)
```

Arguments

grl	a GRangesList
keep.names	a boolean, keep names or not, default: (TRUE)

Value

a character vector or Rle of seqnames(if seqnames == T)

Examples

```
gr_plus <- GRanges(seqnames = c("chr1", "chr1"),
                   ranges = IRanges(c(7, 14), width = 3),
                   strand = c("+", "+"))
gr_minus <- GRanges(seqnames = c("chr2", "chr2"),
                    ranges = IRanges(c(4, 1), c(9, 3)),
                    strand = c("-", "-"))
grl <- GRangesList(tx1 = gr_plus, tx2 = gr_minus)
seqnamesPerGroup(grl)
```

shiftFootprints *Shift footprints by selected offsets*

Description

Function shifts footprints (GRanges) using specified offsets for every of the specified lengths. Reads that do not conform to the specified lengths are filtered out and rejected. Reads are resized to single base in 5' end fashion, treated as p site. This function takes account for junctions in cigars of the reads. Length of the footprint is saved in size' parameter of GRanges output. Footprints are also sorted according to their genomic position, ready to be saved as a ofst, bed or wig file.

Usage

```
shiftFootprints(footprints, shifts, sort = TRUE)
```

Arguments

footprints	GAlignments object of RiboSeq reads
shifts	a data.frame / data.table with minimum 2 columns, fraction (selected_lengths) and selected_shifts (relative position). Output from detectRibosomeShifts
sort	logical, default TRUE. If False will keep original order of reads, and not sort output reads in increasing genomic location per chromosome and strand.

Details

The two columns in the shift data.frame/data.table argument are:
- fraction Numeric vector of lengths of footprints you select for shifting.
- offsets_start Numeric vector of shifts for corresponding selected_lengths. eg. c(-10, -10) with selected_lengths of c(31, 32) means length of 31 will be shifted left by 10. Footprints of length 32 will be shifted right by 10.

NOTE: It will remove softclips from valid width, the CIGAR 3S30M is qwidth 33, but will remove 3S so final read width is 30 in ORFik.

Value

A GRanges object of shifted footprints, sorted and resized to 1bp of p-site, with metacolumn "size" indicating footprint size before shifting and resizing, sorted in increasing order.

Other pshifting: changePointAnalysis(), detectRibosomeShifts(), shiftFootprintsByExperiment()

Examples

```
## Basic run
# Transcriptome annotation ->
gtf_file <- system.file("extdata", "annotations.gtf", package = "ORFik")
# Ribo seq data ->
riboSeq_file <- system.file("extdata", "ribo-seq.bam", package = "ORFik")
## Not run:
footprints <- readBam(riboSeq_file)

# detect the shifts automagically
shifts <- detectRibosomeShifts(footprints, gtf_file)
# shift the RiboSeq footprints
shiftedReads <- shiftFootprints(footprints, shifts)

## End(Not run)
```

`shiftFootprintsByExperiment` *Shift footprints of each file in experiment*

Description

For more details, see: `detectRibosomeShifts`

Usage

```
shiftFootprintsByExperiment(
  df,
  out.dir = pasteDir(dirname(df$filepath[1]), "/pshifted/"),
  start = TRUE,
  stop = FALSE,
  top_tx = 10L,
  minFiveUTR = 30L,
  minCDS = 150L,
  minThreeUTR = 30L,
  firstN = 150L,
  min_reads = 1000,
  accepted.lengths = 26:34,
  output_format = c("ofst", "wig"),
  BPPARAM = bpparam(),
  log = TRUE,
  heatmap = FALSE,
  must.be.periodic = TRUE
)
```

Arguments

`df`	an ORFik `experiment`
`out.dir`	output directory for files, default: dirname(df$filepath[1]), making a /pshifted folder at that location
`start`	(logical) Whether to include predictions based on the start codons. Default TRUE.
`stop`	(logical) Whether to include predictions based on the stop codons. Default FASLE. Only use if there exists 3' UTRs for the annotation. If peridicity around stop codon is stronger than at the start codon, use stop instead of start region for p-shifting.
`top_tx`	(integer), default 10. Specify which reads transcripts to use for estimation of the shifts. By default we take top 10 top covered transcripts as they represent less noisy dataset. This is only applicable when there are more than 1000 transcripts.
`minFiveUTR`	(integer) minimum bp for 5' UTR during filtering for the transcripts. Set to NULL if no 5' UTRs exists for annotation.
`minCDS`	(integer) minimum bp for CDS during filtering for the transcripts
`minThreeUTR`	(integer) minimum bp for 3' UTR during filtering for the transcripts. Set to NULL if no 3' UTRs exists for annotation.

firstN	(integer) Represents how many bases of the transcripts downstream of start codons to use for initial estimation of the periodicity.
min_reads	default (1000), how many reads must a read-length have to be considered for periodicity.
accepted.lengths	accepted readlengths, default 26:34, usually ribo-seq is strongest between 27:32.
output_format	default c("ofst", "wig"), use export.ofst or wiggle format (wig) using export.wiggle ? Default is both. The wig format version can be used in IGV, the score column is counts of that read with that read length, the cigar reference width is lost, ofst is much faster to save and load in R, and retain cigar reference width, but can not be used in IGV. You can also do bedoc format, bed format keeping cigar: export.bedoc. bedoc is usually not used for p-shifting.
BPPARAM	how many cores/threads to use? default: bpparam()
log	logical, default (TRUE), output a log file with parameters used.
heatmap	a logical or character string, default FALSE. If TRUE, will plot heatmap of raw reads before p-shifting to console, to see if shifts given make sense. You can also set a filepath to save the file there.
must.be.periodic	logical TRUE, if FALSE will not filter on periodic read lengths. (The Fourier transform filter will be skipped).

Details

#' Saves files to a specified location as .ofst and .wig, The .ofst file will include a score column containing read width.
The .wig fiels, will be saved in pairs of +/- strand, and score column will be replicates of reads starting at that position, score = 5 means 5 reads.
Remember that different species might have different default Ribosome read lengths, for human, mouse etc, normally around 27:30.

Value

NULL (Objects are saved to out.dir/pshited/"name_pshifted.ofst", wig, bedo or .bedo)

See Also

Other pshifting: changePointAnalysis(), detectRibosomeShifts(), shiftFootprints()

Examples

```
df <- ORFik.template.experiment()
df <- df[3,] #lets only p-shift RFP sample at index 3
# If you want to check it in IGV do:
shiftFootprintsByExperiment(df)
# Then use the .wig files that are created, which are readable in IGV.
# If you only need in R, do: (then you get no .wig files)
#shiftFootprintsByExperiment(df, output_format = "ofst")
```

shiftPlots *Plot shifted heatmaps per library*

Description

A good validation for you p-shifting, to see shifts are corresponding and close to the CDS TIS.

Usage

```
shiftPlots(
  df,
  output = NULL,
  title = "Ribo-seq",
  scoring = "transcriptNormalized",
  addFracPlot = TRUE,
  BPPARAM = bpparam()
)
```

Arguments

df	an ORFik experiment
output	name to save file, full path. (Default NULL) No saving.
title	Title for top of plot, default "Ribo-seq". A more informative name could be "Ribo-seq zebrafish Chew et al. 2013"
scoring	which scoring scheme to use for heatmap, default "transcriptNormalized". Some alternatives: "sum", "zscore".
addFracPlot	logical, default TRUE, add positional sum plot on top per heatmap.
BPPARAM	how many cores/threads to use? default: bpparam()

Value

a ggplot2 grob object

Examples

```
df <- ORFik.template.experiment()
df <- df[3,] #lets only p-shift RFP sample at index 3
#shiftFootprintsByExperiment(df, output_format = "bedo)
#shiftPlots(df, title = "Ribo-seq Human ORFik et al. 2020")
```

shifts.load *Load the shifts from experiment*

Description

When you p-shift using the function shiftFootprintsByExperiment, you will get a list of shifts per library. To automatically load them, you can use this function. Defaults to loading pshifts, if you made a-sites or e-sites, change the path argument to ashifted/eshifted folder instead.

Usage

```
shifts.load(
  df,
  path = pasteDir(dirname(df$filepath[1]), "/pshifted/shifting_table.rds")
)
```

Arguments

df	an ORFik experiment
path	path to .rds file containing the shifts as a list, one list element per shifted bam file.

Value

a list of the shifts, one list element per shifted bam file.

Examples

```
df <- ORFik.template.experiment()
# subset on Ribo-seq
df <- df[df$libtype == "RFP",]
#shiftFootprintsByExperiment(df)
#shifts.load(df)
```

show,experiment-method *experiment show definition*

Description

Show a simplified version of experiment. The show function simplifies the view so that any column of data (like replicate or stage) is not shown, if all values are identical in that column. Filepath is also never shown.

Usage

```
## S4 method for signature 'experiment'
show(object)
```

Arguments

object	an ORFik experiment

Value

print state of experiment

---

simpleLibs *Converted format of NGS libraries*

Description

Export as either .ofst, .bedo or .bedoc files.
Export files as .bedo files: It is a bed file with 2 score columns. Gives a massive speedup when cigar string and bam flags are not needed.
Export files as .bedoc files: If cigar is needed, gives you replicates and cigar, so a fast way to load a GAlignment object, other bam flags are lost. If type is bedoc addSizeColumn and method will be ignored.

Usage

```
simpleLibs(
  df,
  out.dir = dirname(df$filepath[1]),
  addScoreColumn = TRUE,
  addSizeColumn = TRUE,
  must.overlap = NULL,
  method = "None",
  type = "ofst",
  reassign.when.saving = FALSE,
  envir = .GlobalEnv
)
```

Arguments

df	an ORFik experiment
out.dir	optional output directory, default: dirname(df$filepath[1]), if it is NULL, it will just reassign R objects to simplified libraries.
addScoreColumn	logical, default TRUE, if FALSE will not add replicate numbers as score column, see ORFik::convertToOneBasedRanges.
addSizeColumn	logical, default TRUE, if FALSE will not add size (width) as size column, see ORFik::convertToOneBasedRanges. Does not apply for .ofst or .bedoc.
must.overlap	default (NULL), else a GRanges / GRangesList object, so only reads that overlap (must.overlap) are kept. This is useful when you only need the reads over transcript annotation or subset etc.
method	character, default "None", the method to reduce ranges, for more info see convertToOneBasedRanges
type	a character of format, default "ofst". Alternatives: "ofst", "wig","bedo" or "bedoc". Which format you want. Will make a folder within out.dir with this name containing the files.

`reassign.when.saving`
: logical, default FALSE. If TRUE, will reassign library to converted form after saving. Ignored when out.dir = NULL.

`envir`
: which environment to save to, default .GlobalEnv

Details

See `export.bedo` and `export.bedoc` for information on file formats

Value

NULL (saves files to disc or R .GlobalEnv)

Examples

```
df <- ORFik.template.experiment()
#convertLibs(df)
# Keep only 5' ends of reads
#convertLibs(df, method = "5prime")
```

---

sortPerGroup *Sort a GRangesList*

Description

A faster, more versatile reimplementation of `sort.GenomicRanges` for GRangesList, needed since the original works poorly for more than 10k groups. This function sorts each group, where "+" strands are increasing by starts and "-" strands are decreasing by ends.

Usage

```
sortPerGroup(grl, ignore.strand = FALSE, quick.rev = FALSE)
```

Arguments

`grl`
: a `GRangesList`

`ignore.strand`
: a boolean, (default FALSE): should minus strands be sorted from highest to lowest ends. If TRUE: from lowest to highest ends.

`quick.rev`
: default: FALSE, if TRUE, given that you know all ranges are sorted from min to max for both strands, it will only reverse coordinates for minus strand groups, and only if they are in increasing order. Much quicker

Details

Note: will not work if groups have equal names.

Value

an equally named GRangesList, where each group is sorted within group.

Examples

```
gr_plus <- GRanges(seqnames = c("chr1", "chr1"),
                   ranges = IRanges(c(14, 7), width = 3),
                   strand = c("+", "+"))
gr_minus <- GRanges(seqnames = c("chr2", "chr2"),
                    ranges = IRanges(c(1, 4), c(3, 9)),
                    strand = c("-", "-"))
grl <- GRangesList(tx1 = gr_plus, tx2 = gr_minus)
sortPerGroup(grl)
```

`splitIn3Tx` *Create binned coverage of transcripts, split into the 3 parts.*

Description

The 3 parts of transcripts are the leaders, the cds' and trailers. Per transcript part, bin them all to windowSize (default 100), and make a data.table, rows are positions, useful for plotting with ORFik and ggplot2.

Usage

```
splitIn3Tx(
  leaders,
  cds,
  trailers,
  reads,
  windowSize = 100,
  fraction = "1",
  weight = "score",
  is.sorted = FALSE,
  BPPARAM = BiocParallel::SerialParam()
)
```

Arguments

`leaders`	a `GRangesList` of leaders (5' UTRs)
`cds`	a `GRangesList` of coding sequences
`trailers`	a `GRangesList` of trailers (3' UTRs)
`reads`	GRanges or GAlignment of reads
`windowSize`	an integer (100), size of windows (columns)
`fraction`	a character (1), info on reads (which read length, or which type (RNA seq)) (row names)
`weight`	(default: 'score'), if defined a character name of valid meta column in subject. GRanges("chr1", 1, "+", score = 5), would mean score column tells that this alignment region was found 5 times. ORFik .bedo files, contains a score column like this. As do CAGEr CAGE files and many other package formats. You can also assign a score column manually.
`is.sorted`	logical (FALSE), is grl sorted. That is + strand groups in increasing ranges (1,2,3), and - strand groups in decreasing ranges (3,2,1)
`BPPARAM`	how many cores/threads to use? default: bpparam()

Value

a data.table with columns position, score

`stageNames` *Get stage name variants*

Description

Used to standardize nomeclature for experiments.
Example: 64Cell stage is same as 2 hours post fertilization, so all 2hpf will be converted to 64Cell etc.

Usage

```
stageNames()
```

Value

a data.table with 2 columns, the main name, and all name variants of the main name in second column as a list.

See Also

Other experiment_naming: `cellLineNames()`, `conditionNames()`, `libNames()`, `mainNames()`, `repNames()`, `tissueNames()`

`STAR.align.folder` *Align all libraries in folder with STAR*

Description

Does either all files as paired end or single end, so if you have mix, split them in two different folders.
If STAR halts at .... loading genome, it means the STAR index was aborted early, then you need to run: STAR.remove.crashed.genome(), with the genome that crashed, and rerun.

Usage

```
STAR.align.folder(
  input.dir,
  output.dir,
  index.dir,
  star.path = STAR.install(),
  fastp = install.fastp(),
  paired.end = FALSE,
  steps = "tr-ge",
  adapter.sequence = "auto",
  min.length = 20,
  mismatches = 3,
```

```
  trim.front = 0,
  max.multimap = 10,
  alignment.type = "Local",
  max.cpus = min(90, detectCores() - 1),
  wait = TRUE,
  include.subfolders = "n",
  resume = NULL,
  multiQC = TRUE,
 script.folder = system.file("STAR_Aligner", "RNA_Align_pipeline_folder.sh", package =
    "ORFik"),
  script.single = system.file("STAR_Aligner", "RNA_Align_pipeline.sh", package =
    "ORFik")
)
```

Arguments

input.dir	path to fast files to align, the valid input files will be search for from formats: fast files (.fasta, .fastq, .fq, or.fa) with or without compression of .gz. Also either paired end or single end reads. Pairs will automatically be detected from similarity of naming, usualy with a .1 and .2 in the end. If files are renamed, where pairs are not similarily named, this process will fail to find correct pairs.
output.dir	directory to save indices, default: paste0(dirname(arguments[1]), "/STAR_index/"), where arguments is the arguments input for this function.
index.dir	path to STAR index folder. Path returned from ORFik function STAR.index, when you created the index folders.
star.path	path to STAR, default: STAR.install(), if you don't have STAR installed at default location, it will install it there, set path to a runnable star if you already have it.
fastp	path to fastp trimmer, default: install.fastp(), if you have it somewhere else already installed, give the path. Only works for unix (linux or Mac OS), if not on unix, use your favorite trimmer and give the output files from that trimmer as input.dir here.
paired.end	a logical: default FALSE, alternative TRUE. If TRUE, will auto detect pairs by names. If yes running on a folder: The folder must then contain an even number of files and they must be named with the same prefix and sufix of either _1 and _2, 1 and 2, etc. If SRR numbers are used, it will start on lowest and match with second lowest etc.
steps	a character, default: "tr-ge", trimming then genome alignment steps of depletion and alignment wanted: The posible candidates you can use are: • tr : trim reads • co : contamination merged depletion • ph : phix depletion • rR : rrna depletion • nc : ncrna depletion • tR : trna depletion • ge : genome alignment • all: run steps: "tr-co-ge" or "tr-ph-rR-nc-tR-ge", depending on if you have merged contaminants or not

If not "all", a subset of these ("tr-co-ph-rR-nc-tR-ge")
If co (merged contaminants) is used, non of the specific contaminants can be specified, since they should be a subset of co.
The step where you align to the genome is usually always included, unless you are doing pure contaminant analysis. For Ribo-seq and TCP(RCP-seq) you should do rR (ribosomal RNA depletion), so when you made the STAR index you need the rRNA step, either use rRNA from .gtf or manual download. (usually just download a Silva rRNA database for SSU&LSU at: https://www.arb-silva.de/) for your species.

`adapter.sequence`
: character, default: "auto". Auto detect adapter using fastp adapter auto detection, checking first 1.5M reads. (auto detect adapter, is not very reliable for Ribo-seq, so then you must include a manually specified, else alignment will most likely fail!). If already trimmed or trimming not wanted: adapter.sequence = "disable" .You can manually assign adapter like: "ATCTCGTATGCCGTCTTCTGCTTG" or "AAAAAAAAAAAAA". You can also specify one of the three presets:

  - illumina (standard for 100 bp sequencing): AGATCGGAAGAGC
  - small_RNA (standard for ~50 bp sequencing): TGGAATTCTCGG
  - nextera: CTGTCTCTTATA

`min.length`
: 20, minimum length of aligned read without mismatches to pass filter.

`mismatches`
: 3, max non matched bases. Excludes soft-clipping, this only filters reads that have defined mismatches in STAR. Only applies for genome alignment step.

`trim.front`
: 0, default trim 0 bases 5'. For Ribo-seq set use 0. Ignored if tr (trim) is not one of the arguments in "steps"

`max.multimap`
: numeric, default 10. If a read maps to more locations than specified, will skip the read. Set to 1 to only get unique mapping reads. Only applies for genome alignment step. The depletions are allowing for multimapping.

`alignment.type`
: default: "Local": standard local alignment with soft-clipping allowed, "EndToEnd" (global): force end-to-end read alignment, does not soft-clip.

`max.cpus`
: integer, default: min(90, detectCores() - 1), number of threads to use. Default is minimum of 90 and maximum cores - 1. So if you have 8 cores it will use 7.

`wait`
: a logical (not `NA`) indicating whether the R interpreter should wait for the command to finish, or run it asynchronously. This will be ignored (and the interpreter will always wait) if `intern = TRUE`. When running the command asynchronously, no output will be displayed on the `Rgui` console in Windows (it will be dropped, instead).

`include.subfolders`
: "n" (no), do recursive search downwards for fast files if "y".

`resume`
: default: NULL, continue from step, lets say steps are "tr-ph-ge": (trim, phix depletion, genome alignment) and resume is "ge", you will then use the assumed already trimmed and phix depleted data and start at genome alignment, useful if something crashed. Like if you specified wrong STAR version, but the trimming step was completed. Resume mode can only run 1 step at the time.

`multiQC`
: logical, default TRUE. Do mutliQC comparison of STAR alignment between all the samples. Outputted in aligned/LOGS folder. See ?STAR.multiQC

`script.folder`
: location of STAR index script, default internal ORFik file. You can change it and give your own if you need special alignments.

`script.single` location of STAR single file alignment script, default internal ORFik file. You can change it and give your own if you need special alignments.

Details

Can only run on unix systems (Linux and Mac), and requires minimum 30GB memory on genomes like human, rat, zebrafish etc.
If for some reason the internal STAR alignment bash script will not work for you, like if you have a very small genome. You can copy the internal alignment script, edit it and give that as the Index script used for this function.
The trimmer used is fastp (the fastest I could find), works on mac and linux. If you want to use your own trimmer set file1/file2 to the location of the trimmed files from your program.
A note on trimming from creator of STAR about trimming: "adapter trimming it definitely needed for short RNA sequencing. For long RNA-seq, I would agree with Devon that in most cases adapter trimming is not advantageous, since, by default, STAR performs local (not end-to-end) alignment, i.e. it auto-trims." So trimming can be skipped for longer reads.

Value

output.dir, can be used as as input in ORFik::create.experiment

See Also

Other STAR: `STAR.align.single()`, `STAR.allsteps.multiQC()`, `STAR.index()`, `STAR.install()`, `STAR.multiQC()`, `STAR.remove.crashed.genome()`, `getGenomeAndAnnotation()`, `install.fastp()`

Examples

```
# First specify directories wanted
annotation.dir <- "~/Bio_data/references/Human"
fastq.input.dir <- "~/Bio_data/raw_data/Ribo_seq_subtelny/"
bam.output.dir <- "~/Bio_data/processed_data/Ribo_seq_subtelny_2014/"

## Download some SRA data and metadata
# info <- download.SRA.metadata("DRR041459", fastq.input.dir)
# download.SRA(info, fastq.input.dir, rename = FALSE)
## Now align 2 different ways, without and with contaminant depletion

## No contaminant depletion:
# annotation <- getGenomeAndAnnotation("Homo sapiens", annotation.dir)
# index <- STAR.index(annotation)
# STAR.align.folder(fastq.input.dir, bam.output.dir,
#                   index, paired.end = FALSE)

## All contaminants merged:
# annotation <- getGenomeAndAnnotation(
#    organism = "Homo_sapiens",
#    phix = TRUE, ncRNA = TRUE, tRNA = TRUE, rRNA = TRUE,
#    output.dir = annotation.dir
#    )
# index <- STAR.index(annotation)
# STAR.align.folder(fastq.input.dir, bam.output.dir,
#                   index, paired.end = FALSE,
#                   steps = "tr-ge")
```

STAR.align.single *Align single or paired end pair with STAR*

Description

Given a single NGS fastq/fasta library, or a paired setup of 2 mated libraries. Run alignment and optionally remove contaminants.

Usage

```
STAR.align.single(
  file1,
  file2 = NULL,
  output.dir,
  index.dir,
  star.path = STAR.install(),
  fastp = install.fastp(),
  steps = "tr-ge",
  adapter.sequence = "auto",
  min.length = 20,
  mismatches = 3,
  trim.front = 0,
  max.multimap = 10,
  alignment.type = "Local",
  max.cpus = min(90, detectCores() - 1),
  wait = TRUE,
  resume = NULL,
  script.single = system.file("STAR_Aligner", "RNA_Align_pipeline.sh", package =
    "ORFik")
)
```

Arguments

file1	library file, if paired must be R1 file. Allowed formats are: (.fasta, .fastq, .fq, or.fa) with or without compression of .gz. This filename usually contains a suffix of .1
file2	default NULL, set if paired end to R2 file. Allowed formats are: (.fasta, .fastq, .fq, or.fa) with or without compression of .gz. This filename usually contains a suffix of .2
output.dir	directory to save indices, default: paste0(dirname(arguments[1]), "/STAR_index/"), where arguments is the arguments input for this function.
index.dir	path to STAR index folder. Path returned from ORFik function STAR.index, when you created the index folders.
star.path	path to STAR, default: STAR.install(), if you don't have STAR installed at default location, it will install it there, set path to a runnable star if you already have it.
fastp	path to fastp trimmer, default: install.fastp(), if you have it somewhere else already installed, give the path. Only works for unix (linux or Mac OS), if not on unix, use your favorite trimmer and give the output files from that trimmer as input.dir here.

`steps` a character, default: "tr-ge", trimming then genome alignment
steps of depletion and alignment wanted: The posible candidates you can use are:

- tr : trim reads
- co : contamination merged depletion
- ph : phix depletion
- rR : rrna depletion
- nc : ncrna depletion
- tR : trna depletion
- ge : genome alignment
- all: run steps: "tr-co-ge" or "tr-ph-rR-nc-tR-ge", depending on if you have merged contaminants or not

If not "all", a subset of these ("tr-co-ph-rR-nc-tR-ge")
If co (merged contaminants) is used, non of the specific contaminants can be specified, since they should be a subset of co.
The step where you align to the genome is usually always included, unless you are doing pure contaminant analysis. For Ribo-seq and TCP(RCP-seq) you should do rR (ribosomal RNA depletion), so when you made the STAR index you need the rRNA step, either use rRNA from .gtf or manual download. (usually just download a Silva rRNA database for SSU&LSU at: https://www.arb-silva.de/) for your species.

`adapter.sequence` character, default: "auto". Auto detect adapter using fastp adapter auto detection, checking first 1.5M reads. (auto detect adapter, is not very reliable for Ribo-seq, so then you must include a manually specified, else alignment will most likely fail!). If already trimmed or trimming not wanted: adapter.sequence = "disable" .You can manually assign adapter like: "ATCTCGTATGCCGTCTTCTGCTTG" or "AAAAAAAAAAAAA". You can also specify one of the three presets:

- illumina (standard for 100 bp sequencing): AGATCGGAAGAGC
- small_RNA (standard for ~50 bp sequencing): TGGAATTCTCGG
- nextera: CTGTCTCTTATA

`min.length` 20, minimum length of aligned read without mismatches to pass filter.

`mismatches` 3, max non matched bases. Excludes soft-clipping, this only filters reads that have defined mismatches in STAR. Only applies for genome alignment step.

`trim.front` 0, default trim 0 bases 5'. For Ribo-seq set use 0. Ignored if tr (trim) is not one of the arguments in "steps"

`max.multimap` numeric, default 10. If a read maps to more locations than specified, will skip the read. Set to 1 to only get unique mapping reads. Only applies for genome alignment step. The depletions are allowing for multimapping.

`alignment.type` default: "Local": standard local alignment with soft-clipping allowed, "EndToEnd" (global): force end-to-end read alignment, does not soft-clip.

`max.cpus` integer, default: min(90, detectCores() - 1), number of threads to use. Default is minimum of 90 and maximum cores - 1. So if you have 8 cores it will use 7.

wait	a logical (not NA) indicating whether the R interpreter should wait for the command to finish, or run it asynchronously. This will be ignored (and the interpreter will always wait) if intern = TRUE. When running the command asynchronously, no output will be displayed on the Rgui console in Windows (it will be dropped, instead).
resume	default: NULL, continue from step, lets say steps are "tr-ph-ge": (trim, phix depletion, genome alignment) and resume is "ge", you will then use the assumed already trimmed and phix depleted data and start at genome alignment, useful if something crashed. Like if you specified wrong STAR version, but the trimming step was completed. Resume mode can only run 1 step at the time.
script.single	location of STAR single file alignment script, default internal ORFik file. You can change it and give your own if you need special alignments.

Details

Can only run on unix systems (Linux and Mac), and requires minimum 30GB memory on genomes like human, rat, zebrafish etc.
If for some reason the internal STAR alignment bash script will not work for you, like if you have a very small genome. You can copy the internal alignment script, edit it and give that as the Index script used for this function.
The trimmer used is fastp (the fastest I could find), works on mac and linux. If you want to use your own trimmer set file1/file2 to the location of the trimmed files from your program.
A note on trimming from creator of STAR about trimming: "adapter trimming it definitely needed for short RNA sequencing. For long RNA-seq, I would agree with Devon that in most cases adapter trimming is not advantageous, since, by default, STAR performs local (not end-to-end) alignment, i.e. it auto-trims." So trimming can be skipped for longer reads.

Value

output.dir, can be used as as input in ORFik::create.experiment

See Also

Other STAR: STAR.align.folder(), STAR.allsteps.multiQC(), STAR.index(), STAR.install(), STAR.multiQC(), STAR.remove.crashed.genome(), getGenomeAndAnnotation(), install.fastp()

Examples

```
## Specify output libraries:
output.dir <- "/Bio_data/references/Human"
bam.dir <- "data/processed/human_rna_seq"
# arguments <- getGenomeAndAnnotation("Homo sapiens", output.dir)
# index <- STAR.index(arguments, output.dir)
# STAR.align.single("data/raw_data/human_rna_seq/file1.bam", bam.dir,
#                   index)
```

STAR.allsteps.multiQC *Create STAR multiQC plot and table*

Description

Takes a folder with multiple Log.final.out files from STAR, and create a multiQC report. This is automatically run with STAR.align.folder function.

Usage

```
STAR.allsteps.multiQC(folder, steps = "auto")
```

Arguments

folder	path to main output folder of STAR run. The folder that contains /aligned/, "/trim/, "contaminants_depletion" etc. To find the LOGS folders in, to use for summarized statistics.
steps	a character, default "auto". Find which steps you did. If manual, a combination of "tr-co-ge". See STAR alignment functions for description.

Value

data.table of main statistics, plots and data saved to disc. Named: "/00_STAR_LOG_plot.png" and "/00_STAR_LOG_table.csv"

See Also

Other STAR: STAR.align.folder(), STAR.align.single(), STAR.index(), STAR.install(), STAR.multiQC(), STAR.remove.crashed.genome(), getGenomeAndAnnotation(), install.fastp()

STAR.index *Create STAR genome index*

Description

Used as reference when aligning data
Get genome and gtf by running getGenomeAndFasta()

Usage

```
STAR.index(
  arguments,
  output.dir = paste0(dirname(arguments[1]), "/STAR_index/"),
  star.path = STAR.install(),
  max.cpus = min(90, detectCores() - 1),
  max.ram = 30,
  SAsparse = 1,
  wait = TRUE,
  remake = FALSE,
  script = system.file("STAR_Aligner", "STAR_MAKE_INDEX.sh", package = "ORFik")
)
```

Arguments

arguments	a named character vector containing paths wanted to use for index creation. They must be named correctly: names must be a subset of: c("gtf", "genome", "phix", "rRNA", "tRNA","ncRNA")
output.dir	directory to save indices, default: paste0(dirname(arguments[1]), "/STAR_index/"), where arguments is the arguments input for this function.
star.path	path to STAR, default: STAR.install(), if you don't have STAR installed at default location, it will install it there, set path to a runnable star if you already have it.
max.cpus	integer, default: min(90, detectCores() - 1), number of threads to use. Default is minimum of 90 and maximum cores - 1. So if you have 8 cores it will use 7.
max.ram	integer, default 30, in Giga Bytes (GB). Maximum amount of RAM allowed for STAR limitGenomeGenerateRAM argument. RULE: idealy 10x genome size, but do not set too close to machine limit. Default fits well for human genome size (3 GB * 10 = 30 GB)
SAsparse	int > 0, default 1. If you do not have at least 64GB RAM, you might need to set this to 2. suffux array sparsity, i.e. distance between indices: use bigger numbers to decrease needed RAM at the cost of mapping speed reduction. Only applies to genome, not conaminants.
wait	a logical (not NA) indicating whether the R interpreter should wait for the command to finish, or run it asynchronously. This will be ignored (and the interpreter will always wait) if intern = TRUE. When running the command asynchronously, no output will be displayed on the Rgui console in Windows (it will be dropped, instead).
remake	logical, default: FALSE, if TRUE remake everything specified
script	location of STAR index script, default internal ORFik file. You can change it and give your own if you need special alignments.

Details

Can only run on unix systems (Linux and Mac), and requires minimum 30GB memory on genomes like human, rat, zebrafish etc.
If for some reason the internal STAR index bash script will not work for you, like if you have a very small genome. You can copy the internal index script, edit it and give that as the Index script used for this function.

Value

output.dir, can be used as as input for STAR.align..

See Also

Other STAR: STAR.align.folder(), STAR.align.single(), STAR.allsteps.multiQC(), STAR.install(), STAR.multiQC(), STAR.remove.crashed.genome(), getGenomeAndAnnotation(), install.fastp()

Examples

```
## Manual way, specify all paths yourself.
#arguments <- c(path.GTF, path.genome, path.phix, path.rrna, path.trna, path.ncrna)
#names(arguments) <- c("gtf", "genome", "phix", "rRNA", "tRNA","ncRNA")
#STAR.index(arguments, "output.dir")
```

```
## Or use ORFik way:
output.dir <- "/Bio_data/references/Human"
# arguments <- getGenomeAndAnnotation("Homo sapiens", output.dir)
# STAR.index(arguments, output.dir)
```

`STAR.install` *Download and prepare STAR*

Description

Will not run "make", only use precompiled STAR file.
Can only run on unix systems (Linux and Mac), and requires minimum 30GB memory on genomes like human, rat, zebrafish etc.

Usage

```
STAR.install(folder = "~/bin", version = "2.7.4a")
```

Arguments

`folder`	path to folder for download, fille will be named "STAR-version", where version is version wanted.
`version`	default "2.7.4a"

Details

ORFik for now only uses precompiled STAR binaries, so if you already have a STAR version it is adviced to redownload the same version, since STAR genome indices usually does not work between STAR versions.

Value

path to runnable STAR

References

https://www.ncbi.nlm.nih.gov/pubmed/23104886

See Also

Other STAR: `STAR.align.folder()`, `STAR.align.single()`, `STAR.allsteps.multiQC()`, `STAR.index()`, `STAR.multiQC()`, `STAR.remove.crashed.genome()`, `getGenomeAndAnnotation()`, `install.fastp()`

Examples

```
## Default folder install:
#STAR.install()
## Manual set folder:
folder <- "/I/WANT/IT/HERE"
#STAR.install(folder, version = "2.7.4a")
```

`STAR.multiQC` *Create STAR multiQC plot and table*

Description

Takes a folder with multiple Log.final.out files from STAR, and create a multiQC report

Usage

```
STAR.multiQC(folder, type = "aligned")
```

Arguments

`folder`	path to LOGS folder of ORFik STAR runs. Can also be the path to the aligned/ (parent directory of LOGS), then it will move into LOG from there. Only if no files with pattern Log.final.out are found in parent directory. If no LOGS folder is found it can check for a folder /aligned/LOGS/ so to go 2 folders down.
`type`	a character path, default "aligned". Which subfolder to check for. If you want log files for contamination do type = "contaminants_depletion"

Value

a data.table with all information from STAR runs, plot and data saved to disc. Named: "/00_STAR_LOG_plot.png" and "/00_STAR_LOG_table.csv"

See Also

Other STAR: `STAR.align.folder()`, `STAR.align.single()`, `STAR.allsteps.multiQC()`, `STAR.index()`, `STAR.install()`, `STAR.remove.crashed.genome()`, `getGenomeAndAnnotation()`, `install.fastp()`

`STAR.remove.crashed.genome` *Remove crashed STAR genome*

Description

This happens if you abort STAR run early, and it halts at: ..... loading genome

Usage

```
STAR.remove.crashed.genome(index.path, star.path = STAR.install())
```

Arguments

`index.path`	path to index folder of genome
`star.path`	path to STAR, default: STAR.install(), if you don't have STAR installed at default location, it will install it there, set path to a runnable star if you already have it.

Value

return value from system call, 0 if all good.

See Also

Other STAR: STAR.align.folder(), STAR.align.single(), STAR.allsteps.multiQC(), STAR.index(), STAR.install(), STAR.multiQC(), getGenomeAndAnnotation(), install.fastp()

Examples

```
index.path = "/home/data/human_GRCh38/STAR_INDEX/genomeDir/"
# STAR.remove.crashed.genome(index.path = index.path)
## If you have the index argument from STAR.index function:
# index.path <- STAR.index()
# STAR.remove.crashed.genome(file.path(index.path, "genomeDir"))
# STAR.remove.crashed.genome(file.path(index.path, "contaminants_genomeDir"))
```

---

startCodons *Get the Start codons(3 bases) from a GRangesList of orfs grouped by orfs*

Description

In ATGTTTTGA, get the positions ATG. It takes care of exons boundaries, with exons < 3 length.

Usage

```
startCodons(grl, is.sorted = FALSE)
```

Arguments

grl	a GRangesList object
is.sorted	a boolean, a speedup if you know the ranges are sorted

Value

a GRangesList of start codons, since they might be split on exons

See Also

Other ORFHelpers: defineTrailer(), longestORFs(), mapToGRanges(), orfID(), startSites(), stopCodons(), stopSites(), txNames(), uniqueGroups(), uniqueOrder()

Examples

```
gr_plus <- GRanges(seqnames = "chr1",
                   ranges = IRanges(c(7, 14), width = 3),
                   strand = "+")
gr_minus <- GRanges(seqnames = "chr2",
                    ranges = IRanges(c(4, 1), c(9, 3)),
                    strand = "-")
grl <- GRangesList(tx1 = gr_plus, tx2 = gr_minus)
startCodons(grl, is.sorted = FALSE)
```

startDefinition *Returns start codon definitions*

Description

According to: <http://www.ncbi.nlm.nih.gov/Taxonomy/taxonomyhome.html/ index.cgi?chapter=tgencodes#SG1> ncbi genetic code number for translation. This version is a cleaned up version, unknown indices removed.

Usage

```
startDefinition(transl_table)
```

Arguments

transl_table	numeric. NCBI genetic code number for translation.

Value

A string of START sites separatd with "|".

See Also

Other findORFs: `findMapORFs()`, `findORFsFasta()`, `findORFs()`, `findUORFs()`, `stopDefinition()`

Examples

```
startDefinition
startDefinition(1)
```

startRegion *Start region as GRangesList*

Description

Get the start region of each ORF. If you want the start codon only, set upstream = 0 or just use `startCodons`. Standard is 2 upstream and 2 downstream, a width 5 window centered at start site. since p-shifting is not 100 usually the reads from the start site.

Usage

```
startRegion(grl, tx = NULL, is.sorted = TRUE, upstream = 2L, downstream = 2L)
```

Arguments

grl	a GRangesList object with usually either leaders, cds', 3' utrs or ORFs
tx	default NULL, a GRangesList of transcripts or (container region), names of tx must contain all grl names. The names of grl can also be the ORFik orf names. that is "txName_id"
is.sorted	logical (TRUE), is grl sorted.
upstream	an integer (2), relative region to get upstream from.
downstream	an integer (2), relative region to get downstream from

Details

If tx is null, then upstream will be forced to 0 and downstream to a maximum of grl width (3' UTR end for mRNAs). Since there is no reference for splicing.

Value

a GRanges, or GRangesList object if any group had > 1 exon.

See Also

Other features: computeFeaturesCage(), computeFeatures(), countOverlapsW(), disengagementScore(), distToCds(), distToTSS(), entropy(), floss(), fpkm_calc(), fpkm(), fractionLength(), initiationScore(), insideOutsideORF(), isInFrame(), isOverlapping(), kozakSequenceScore(), orfScore(), rankOrder(), ribosomeReleaseScore(), ribosomeStallingScore(), startRegionCoverage(), stopRegion(), subsetCoverage(), translationalEff()

Examples

```
## ORF start region
orf <- GRangesList(tx1 = GRanges("1", 200:300, "+"))
tx <- GRangesList(tx1 = GRanges("1",
                  IRanges(c(100, 200), c(195, 400)), "+"))
startRegion(orf, tx, upstream = 6, downstream = 6)
## 2nd codon of ORF
startRegion(orf, tx, upstream = -3, downstream = 6)
```

---

startRegionCoverage *Start region coverage*

Description

Get the number of reads in the start region of each ORF. If you want the start codon coverage only, set upstream = 0. Standard is 2 upstream and 2 downstream, a width 5 window centered at start site. since p-shifting is not 100 start site.

Usage

```
startRegionCoverage(
  grl,
  RFP,
  tx = NULL,
  is.sorted = TRUE,
  upstream = 2L,
  downstream = 2L,
  weight = 1L
)
```

Arguments

grl	a GRangesList object with usually either leaders, cds', 3' utrs or ORFs
RFP	ribo seq reads as GAlignments, GRanges or GRangesList object
tx	default NULL, a GRangesList of transcripts or (container region), names of tx must contain all grl names. The names of grl can also be the ORFik orf names. that is "txName_id"
is.sorted	logical (TRUE), is grl sorted.
upstream	an integer (2), relative region to get upstream from.
downstream	an integer (2), relative region to get downstream from
weight	a vector (default: 1L, if 1L it is identical to countOverlaps()), if single number (!= 1), it applies for all, if more than one must be equal size of 'reads'. else it must be the string name of a defined meta column in subject "reads", that gives number of times a read was found. GRanges("chr1", 1, "+", score = 5), would mean "score" column tells that this alignment region was found 5 times.

Details

If tx is null, then upstream will be force to 0 and downstream to a maximum of grl width. Since there is no reference for splicing.

Value

a numeric vector of counts

See Also

Other features: computeFeaturesCage(), computeFeatures(), countOverlapsW(), disengagementScore(), distToCds(), distToTSS(), entropy(), floss(), fpkm_calc(), fpkm(), fractionLength(), initiationScore(), insideOutsideORF(), isInFrame(), isOverlapping(), kozakSequenceScore(), orfScore(), rankOrder(), ribosomeReleaseScore(), ribosomeStallingScore(), startRegion(), stopRegion(), subsetCoverage(), translationalEff()

startRegionString *Get start region as DNA-strings per GRanges group*

Description

One window per start site, if upstream and downstream are both 0, then only the startsite is returned.

Usage

```
startRegionString(grl, tx, faFile, upstream = 20, downstream = 20)
```

Arguments

grl	a GRangesList of ranges to find regions in.
tx	a GRangesList of transcripts or (container region), names of tx must contain all gr names. The names of gr can also be the ORFik orf names. that is "tx-Name_id".
faFile	FaFile, BSgenome, fasta/index file path or an ORFik experiment. This file is usually used to find the transcript sequences from some GRangesList.
upstream	an integer, default (0), relative region to get upstream from.
downstream	an integer, default (0), relative region to get downstream from

Value

a character vector of start regions

startSites *Get the start sites from a GRangesList of orfs grouped by orfs*

Description

In ATGTTTTGG, get the position of the A.

Usage

```
startSites(grl, asGR = FALSE, keep.names = FALSE, is.sorted = FALSE)
```

Arguments

grl	a GRangesList object
asGR	a boolean, return as GRanges object
keep.names	a logical (FALSE), keep names of input.
is.sorted	a speedup, if you know the ranges are sorted

Value

if asGR is False, a vector, if True a GRanges object

See Also

Other ORFHelpers: defineTrailer(), longestORFs(), mapToGRanges(), orfID(), startCodons(), stopCodons(), stopSites(), txNames(), uniqueGroups(), uniqueOrder()

Examples

```
gr_plus <- GRanges(seqnames = c("chr1", "chr1"),
                   ranges = IRanges(c(7, 14), width = 3),
                   strand = c("+", "+"))
gr_minus <- GRanges(seqnames = c("chr2", "chr2"),
                    ranges = IRanges(c(4, 1), c(9, 3)),
                    strand = c("-", "-"))
grl <- GRangesList(tx1 = gr_plus, tx2 = gr_minus)
startSites(grl, is.sorted = FALSE)
```

---

stopCodons *Get the Stop codons (3 bases) from a GRangesList of orfs grouped by orfs*

Description

In ATGTTTTGA, get the positions TGA. It takes care of exons boundaries, with exons < 3 length.

Usage

```
stopCodons(grl, is.sorted = FALSE)
```

Arguments

grl	a GRangesList object
is.sorted	a boolean, a speedup if you know the ranges are sorted

Value

a GRangesList of stop codons, since they might be split on exons

See Also

Other ORFHelpers: defineTrailer(), longestORFs(), mapToGRanges(), orfID(), startCodons(), startSites(), stopSites(), txNames(), uniqueGroups(), uniqueOrder()

Examples

```
gr_plus <- GRanges(seqnames = c("chr1", "chr1"),
                   ranges = IRanges(c(7, 14), width = 3),
                   strand = c("+", "+"))
gr_minus <- GRanges(seqnames = c("chr2", "chr2"),
                    ranges = IRanges(c(4, 1), c(9, 3)),
                    strand = c("-", "-"))
grl <- GRangesList(tx1 = gr_plus, tx2 = gr_minus)
stopCodons(grl, is.sorted = FALSE)
```

stopDefinition *Returns stop codon definitions*

Description

According to: <http://www.ncbi.nlm.nih.gov/Taxonomy/taxonomyhome.html/ index.cgi?chapter=tgencodes#SG1> ncbi genetic code number for translation. This version is a cleaned up version, unknown indices removed.

Usage

```
stopDefinition(transl_table)
```

Arguments

transl_table	numeric. NCBI genetic code number for translation.

Value

A string of STOP sites separatd with "|".

See Also

Other findORFs: `findMapORFs()`, `findORFsFasta()`, `findORFs()`, `findUORFs()`, `startDefinition()`

Examples

```
stopDefinition
stopDefinition(1)
```

stopRegion *Stop region as GRangesList*

Description

Get the stop region of each ORF / region. If you want the stop codon only, set upstream = 0 or just use `stopCodons`. Standard is 2 upstream and 2 downstream, a width 5 window centered at stop site.

Usage

```
stopRegion(grl, tx = NULL, is.sorted = TRUE, upstream = 2L, downstream = 2L)
```

Arguments

grl	a `GRangesList` object with usually either leaders, cds', 3' utrs or ORFs
tx	default NULL, a GRangesList of transcripts or (container region), names of tx must contain all grl names. The names of grl can also be the ORFik orf names. that is "txName_id"
is.sorted	logical (TRUE), is grl sorted.
upstream	an integer (2), relative region to get upstream from.
downstream	an integer (2), relative region to get downstream from

Details

If tx is null, then downstream will be forced to 0 and upstream to a minimum of -grl width (to the TSS). . Since there is no reference for splicing.

Value

a GRanges, or GRangesList object if any group had > 1 exon.

See Also

Other features: computeFeaturesCage(), computeFeatures(), countOverlapsW(), disengagementScore(), distToCds(), distToTSS(), entropy(), floss(), fpkm_calc(), fpkm(), fractionLength(), initiationScore(), insideOutsideORF(), isInFrame(), isOverlapping(), kozakSequenceScore(), orfScore(), rankOrder(), ribosomeReleaseScore(), ribosomeStallingScore(), startRegionCoverage(), startRegion(), subsetCoverage(), translationalEff()

Examples

```
## ORF stop region
orf <- GRangesList(tx1 = GRanges("1", 200:300, "+"))
tx <- GRangesList(tx1 = GRanges("1",
                   IRanges(c(100, 305), c(300, 400)), "+"))
stopRegion(orf, tx, upstream = 6, downstream = 6)
## 2nd last codon of ORF
stopRegion(orf, tx, upstream = 6, downstream = -3)
```

---

stopSites *Get the stop sites from a GRangesList of orfs grouped by orfs*

Description

In ATGTTTTGC, get the position of the C.

Usage

```
stopSites(grl, asGR = FALSE, keep.names = FALSE, is.sorted = FALSE)
```

Arguments

grl	a GRangesList object
asGR	a boolean, return as GRanges object
keep.names	a logical (FALSE), keep names of input.
is.sorted	a speedup, if you know the ranges are sorted

Value

if asGR is False, a vector, if True a GRanges object

See Also

Other ORFHelpers: defineTrailer(), longestORFs(), mapToGRanges(), orfID(), startCodons(), startSites(), stopCodons(), txNames(), uniqueGroups(), uniqueOrder()

Examples

```
gr_plus <- GRanges(seqnames = c("chr1", "chr1"),
                   ranges = IRanges(c(7, 14), width = 3),
                   strand = c("+", "+"))
gr_minus <- GRanges(seqnames = c("chr2", "chr2"),
                    ranges = IRanges(c(4, 1), c(9, 3)),
                    strand = c("-", "-"))
grl <- GRangesList(tx1 = gr_plus, tx2 = gr_minus)
stopSites(grl, is.sorted = FALSE)
```

---

strandBool *Get logical list of strands*

Description

Helper function to get a logical list of True/False, if GRangesList group have + strand = T, if - strand = F Also checks for * strands, so a good check for bugs

Usage

```
strandBool(grl)
```

Arguments

grl	a GRangesList or GRanges object

Value

a logical vector

Examples

```
gr <- GRanges(Rle(c("chr2", "chr2", "chr1", "chr3"), c(1, 3, 2, 4)),
              IRanges(1:10, width = 10:1),
              Rle(strand(c("-", "+", "*", "+", "-")), c(1, 2, 2, 3, 2)))
strandBool(gr)
```

---

strandPerGroup *Get list of strands per granges group*

Description

Get list of strands per granges group

Usage

```
strandPerGroup(grl, keep.names = TRUE)
```

Arguments

grl	a GRangesList
keep.names	a boolean, keep names or not, default: (TRUE)

Value

a vector named/unnamed of characters

Examples

```
gr_plus <- GRanges(seqnames = c("chr1", "chr1"),
                   ranges = IRanges(c(7, 14), width = 3),
                   strand = c("+", "+"))
gr_minus <- GRanges(seqnames = c("chr2", "chr2"),
                    ranges = IRanges(c(4, 1), c(9, 3)),
                    strand = c("-", "-"))
grl <- GRangesList(tx1 = gr_plus, tx2 = gr_minus)
strandPerGroup(grl)
```

---

subsetCoverage *Subset GRanges to get coverage.*

Description

GRanges object should be beforehand tiled to size of 1. This subsetting takes account for strand.

Usage

```
subsetCoverage(cov, y)
```

Arguments

cov	A coverage object from coverage()
y	GRanges object for which coverage should be extracted

Value

numeric vector of coverage of input GRanges object

See Also

Other features: computeFeaturesCage(), computeFeatures(), countOverlapsW(), disengagementScore(), distToCds(), distToTSS(), entropy(), floss(), fpkm_calc(), fpkm(), fractionLength(), initiationScore(), insideOutsideORF(), isInFrame(), isOverlapping(), kozakSequenceScore(), orfScore(), rankOrder(), ribosomeReleaseScore(), ribosomeStallingScore(), startRegionCoverage(), startRegion(), stopRegion(), translationalEff()

subsetToFrame *Subset GRanges to get desired frame.*

Description

Usually used for ORFs to get specific frame (0-2): frame 0, frame 1, frame 2

Usage

```
subsetToFrame(x, frame)
```

Arguments

x	A tiled to size of 1 GRanges object
frame	A numeric indicating which frame to extract

Details

GRanges object should be beforehand tiled to size of 1. This subsetting takes account for strand.

Value

GRanges object reduced to only first frame

te.plot *Translational efficiency plots*

Description

Create 2 TE plots of:
- Within sample (TE log2 vs mRNA fpkm) ("default")
- Between all combinations of samples (x-axis: rna1fpkm - rna2fpkm, y-axis rfp1fpkm - rfp2fpkm)

Usage

```
te.plot(
  df.rfp,
  df.rna,
  output.dir = paste0(dirname(df.rfp$filepath[1]), "/QC_STATS/"),
  type = c("default", "between"),
  filter.rfp = 1,
  filter.rna = 1,
  collapse = FALSE,
  plot.title = "",
  width = 6,
  height = "auto"
)
```

Arguments

df.rfp	a experiment of Ribo-seq or 80S from TCP-seq.
df.rna	a experiment of RNA-seq
output.dir	directory to save plots, plots will be named "TE_between.png" and "TE_within.png"
type	which plots to make, default: c("default", "between"). Both plots.
filter.rfp	numeric, default 1. minimum fpkm value to be included in plots
filter.rna	numeric, default 1. minimum fpkm value to be included in plots
collapse	a logical/character (default FALSE), if TRUE all samples within the group SAMPLE will be collapsed to one. If "all", all groups will be merged into 1 column called merged_all. Collapse is defined as rowSum(elements_per_group) / ncol(elements_per_group)
plot.title	title for plots, usually name of experiment etc
width	numeric, default 6 (in inches)
height	numeric or character, default "auto", which is: 3 + (ncol(RFP_CDS_FPKM)-2). Else a numeric value of height (in inches)

Details

Ribo-seq and RNA-seq must have equal nrows, with matching samples. Only exception is if RNA-seq is 1 single sample. Then it will use that for each of the Ribo-seq samples. Same stages, conditions etc, with a unique pairing 1 to 1. If not you can run collapse = "all". It will then merge all and do combined of all RNA-seq vs all Ribo-seq

Value

a data.table with TE values, fpkm and log fpkm values, library samples melted into rows with split variable called "variable".

Examples

```
##
# df.rfp <- read.experiment("zf_baz14_RFP")
# df.rna <- read.experiment("zf_baz14_RNA")
# te.plot(df.rfp, df.rna)
## Collapse replicates:
# te.plot(df.rfp, df.rna, collapse = TRUE)
```

---

te.table *Create a TE table*

Description

Creates a data.table with 6 columns, column names are:
variable, rfp_log2, rna_log2, rna_log10, TE_log2, id

Usage

```
te.table(df.rfp, df.rna, filter.rfp = 1, filter.rna = 1, collapse = FALSE)
```

Arguments

df.rfp	a experiment of Ribo-seq or 80S from TCP-seq.
df.rna	a experiment of RNA-seq
filter.rfp	numeric, default 1. What is the minimum fpkm value?
filter.rna	numeric, default 1. What is the minimum fpkm value?
collapse	a logical/character (default FALSE), if TRUE all samples within the group SAMPLE will be collapsed to one. If "all", all groups will be merged into 1 column called merged_all. Collapse is defined as rowSum(elements_per_group) / ncol(elements_per_group)

Value

a data.table with 6 columns

See Also

Other TE: DTEG.analysis(), DTEG.plot(), te_rna.plot()

Examples

```
#df.rfp <- read.experiment("Riboseq")
#df.rna <- read.experiment("RNAseq")
#te.table(df.rfp, df.rna)
```

---

te_rna.plot *Translational efficiency plots*

Description

Create TE plot of:
- Within sample (TE log2 vs mRNA fpkm)

Usage

```
te_rna.plot(
  dt,
  output.dir = NULL,
  filter.rfp = 1,
  filter.rna = 1,
  plot.title = "",
  width = 6,
  height = "auto",
  dot.size = 0.4
)
```

Arguments

dt	a data.table with the results from te.table
output.dir	a character path, default NULL(no save), or a directory to save to a file will be called "TE_within.png"
filter.rfp	numeric, default 1. What is the minimum fpkm value?
filter.rna	numeric, default 1. What is the minimum fpkm value?
plot.title	title for plots, usually name of experiment etc
width	numeric, default 6 (in inches)
height	a numeric, width of plot in inches. Default "auto".
dot.size	numeric, default 0.4, size of point dots in plot.

Value

a ggplot object

See Also

Other TE: DTEG.analysis(), DTEG.plot(), te.table()

Examples

```
#df.rfp <- read.experiment("Riboseq")
#df.rna <- read.experiment("RNAseq")
#dt <- te.table(df.rfp, df.rna)
#te_rna.plot(dt)
```

---

tile1 *Tile each GRangesList group to 1-base resolution.*

Description

Will tile a GRangesList into single bp resolution, each group of the list will be splited by positions of 1. Returned values are sorted as the same groups as the original GRangesList, except they are in bp resolutions. This is not supported originally by GenomicRanges for GRangesList.

Usage

```
tile1(grl, sort.on.return = TRUE, matchNaming = TRUE)
```

Arguments

grl	a GRangesList object with names
sort.on.return	logical (T), should the groups be sorted before return.
matchNaming	logical (T), should groups keep unlisted names and meta data.(This make the list very big, for > 100K groups)

Value

a GRangesList grouped by original group, tiled to 1

See Also

Other ExtendGenomicRanges: asTX(), coveragePerTiling(), extendLeaders(), extendTrailers(), reduceKeepAttr(), txSeqsFromFa(), windowPerGroup()

Examples

```
gr1 <- GRanges("1", ranges = IRanges(start = c(1, 10, 20),
                                     end = c(5, 15, 25)),
               strand = "+")
gr2 <- GRanges("1", ranges = IRanges(start = c(20, 30, 40),
                                     end = c(25, 35, 45)),
               strand = "+")
names(gr1) = rep("tx1_1", 3)
names(gr2) = rep("tx1_2", 3)
grl <- GRangesList(tx1_1 = gr1, tx1_2 = gr2)
tile1(grl)
```

---

tissueNames *Get tissue name variants*

Description

Used to standardize nomeclature for experiments.
Example: testis is main naming, but a variant is testicles. testicles will then be renamed to testis.

Usage

```
tissueNames()
```

Value

a data.table with 2 columns, the main name, and all name variants of the main name in second column as a list.

See Also

Other experiment_naming: cellLineNames(), conditionNames(), libNames(), mainNames(), repNames(), stageNames()

TOP.Motif.ecdf *TOP Motif ecdf plot*

Description

Given sequences, DNA or RNA. And some score, scanning efficiency (SE), ribo-seq fpkm, TE etc.

Usage

```
TOP.Motif.ecdf(
  seqs,
  rate,
  start = 1,
  stop = max(nchar(seqs)),
  xlim = c("q10", "q99"),
  type = "Scanning efficiency",
  legend.position.1st = c(0.75, 0.28),
  legend.position.motif = c(0.75, 0.28)
)
```

Arguments

seqs	the sequences (character vector, DNAStringSet), of 5' UTRs (leaders). See example below for input.
rate	a scoring vector (equal size to seqs)
start	position in seqs to start at (first is 1), default 1.
stop	position in seqs to stop at (first is 1), default max(nchar(seqs)), that is the longest sequence length
xlim	What interval of rate values you want to show type: numeric or quantile of length 2, 1. default c("q10","q99"). bigger than 10 percentile and less than 99 percentile. 2. Set to numeric values, like c(5, 1000), 3. Set to NULL if you want all values. Backend uses coord_cartesian.
type	What type is the rate scoring ? default ("Scanning efficiency")
legend.position.1st	adjust left plot label position, default c(0.75, 0.28), ("none", "left", "right", "bottom", "top", or two-element numeric vector)
legend.position.motif	adjust right plot label position, default c(0.75, 0.28), ("none", "left", "right", "bottom", "top", or two-element numeric vector)

Details

Top motif defined as a TSS of C and 4 T's or C's (pyrimidins) downstream of TSS C.

The right plot groups: C nucleotide, TOP motif (C, then 4 pyrimidines) and OTHER (all other TSS variants).

Value

a ggplot gtable of the TOP motifs in 2 plots

Examples

```
## Not run:
if (requireNamespace("BSgenome.Hsapiens.UCSC.hg19")) {
  txdbFile <- system.file("extdata", "hg19_knownGene_sample.sqlite",
                          package = "GenomicFeatures")
  #Extract sequences of Coding sequences.
  leaders <- loadRegion(txdbFile, "leaders")
```

```
  # Should update by CAGE if not already done
  cageData <- system.file("extdata", "cage-seq-heart.bed.bgz",
                          package = "ORFik")
  leadersCage <- reassignTSSbyCage(leaders, cageData)
  # Get region to check
  seqs <- startRegionString(leadersCage, NULL,
        BSgenome.Hsapiens.UCSC.hg19::Hsapiens, 0, 4)
  # Some toy ribo-seq fpkm scores on cds
  set.seed(3)
  fpkm <- sample(1:115, length(leadersCage), replace = TRUE)
  # Standard arguments
  TOP.Motif.ecdf(seqs, fpkm, type = "ribo-seq FPKM",
                 legend.position.1st = "bottom",
                 legend.position.motif = "bottom")
  # with no zoom on x-axis:
  TOP.Motif.ecdf(seqs, fpkm, xlim = NULL,
                 legend.position.1st = "bottom",
                 legend.position.motif = "bottom")
}

## End(Not run)
```

`topMotif` *TOP Motif detection*

Description

Per leader, detect if the leader has a TOP motif at TSS (5' end of leader) TOP motif defined as: (C, then 4 pyrimidines)

Usage

```
topMotif(seqs, start = 1, stop = max(nchar(seqs)), return.sequence = TRUE)
```

Arguments

`seqs`	the sequences (character vector, DNAStringSet), of 5' UTRs (leaders) start region. seqs must be of minimum widths start - stop + 1 to be included. See example below for input.
`start`	position in seqs to start at (first is 1), default 1.
`stop`	position in seqs to stop at (first is 1), default max(nchar(seqs)), that is the longest sequence length
`return.sequence`	logical, default TRUE, return as data.table with sequence as columns in addition to TOP class. If FALSE, return character vector.

Value

default: return.sequence == FALSE, a character vector of either TOP, C or OTHER. C means leaders started on C, Other means not TOP and did not start on C. If return.sequence == TRUE, a data.table is returned with the base per position in the motif is included as additional columns (per position called seq1, seq2 etc) and a id column called X.gene_id (with names of seqs).

Examples

```
## Not run:
if (requireNamespace("BSgenome.Hsapiens.UCSC.hg19")) {
  txdbFile <- system.file("extdata", "hg19_knownGene_sample.sqlite",
                          package = "GenomicFeatures")
  #Extract sequences of Coding sequences.
  leaders <- loadRegion(txdbFile, "leaders")

  # Should update by CAGE if not already done
  cageData <- system.file("extdata", "cage-seq-heart.bed.bgz",
                          package = "ORFik")
  leadersCage <- reassignTSSbyCage(leaders, cageData)
  # Get region to check
  seqs <- startRegionString(leadersCage, NULL,
        BSgenome.Hsapiens.UCSC.hg19::Hsapiens, 0, 4)
  topMotif(seqs)
  }

## End(Not run)
```

`transcriptWindow` *Make 100 bases size meta window for all libraries in experiment*

Description

Gives you binned meta coverage plots, either saved seperatly or all in one.

Usage

```
transcriptWindow(
  leaders,
  cds,
  trailers,
  df,
  outdir = NULL,
  scores = c("sum", "zscore"),
  allTogether = TRUE,
  colors = experiment.colors(df),
  title = "Coverage metaplot",
 windowSize = min(100, min(widthPerGroup(leaders, FALSE)), min(widthPerGroup(cds,
    FALSE)), min(widthPerGroup(trailers, FALSE))),
  returnPlot = is.null(outdir),
  dfr = NULL,
  idName = "",
  format = ".png",
  type = "ofst",
  is.sorted = FALSE,
  BPPARAM = bpparam()
)
```

Arguments

leaders	a GRangesList of leaders (5' UTRs)
cds	a GRangesList of coding sequences
trailers	a GRangesList of trailers (3' UTRs)
df	an ORFik experiment
outdir	directory to save to (default: NULL, no saving)
scores	scoring function (default: c("sum", "zscore")), see ?coverageScorings for possible scores.
allTogether	plot all coverage plots in 1 output? (defualt: TRUE)
colors	Which colors to use, default auto color from function experiment.colors, new color per library type. Else assign colors yourself.
title	title of ggplot
windowSize	size of binned windows, default: 100
returnPlot	return plot from function, default is.null(outdir), so TRUE if outdir is not defined.
dfr	an ORFik experiment of RNA-seq to normalize against. Will add RNA normalized to plot name if this is done.
idName	A character ID to add to saved name of plot, if you make several plots in the same folder, and same experiment, like splitting transcripts in two groups like targets / nontargets etc. (default: "")
format	default (".png"), do ".pdf" if you want as pdf
type	a character(default: "bedoc"), load files in experiment or some precomputed variant, either "bedo", "bedoc", "pshifted" or default. These are made with ORFik:::simpleLibs(), shiftFootprintsByExperiment().. Will load default if bedoc is not found
is.sorted	logical (FALSE), is grl sorted. That is + strand groups in increasing ranges (1,2,3), and - strand groups in decreasing ranges (3,2,1)
BPPARAM	how many cores/threads to use? default: bpparam()

Value

NULL, or ggplot object if returnPlot is TRUE

See Also

Other experiment plots: transcriptWindow1(), transcriptWindowPer()

Examples

```
df <- ORFik.template.experiment()[3,] # Only third library
loadRegions(df) # Load leader, cds and trailers as GRangesList
#transcriptWindow(leaders, cds, trailers, df, outdir = "directory/to/save")
```

`transcriptWindow1` *Meta coverage over all transcripts*

Description

Given as single window

Usage

```
transcriptWindow1(
  df,
  outdir = NULL,
  scores = c("sum", "zscore"),
  colors = experiment.colors(df),
  title = "Coverage metaplot",
  windowSize = 100,
  returnPlot = is.null(outdir),
  dfr = NULL,
  idName = "",
  format = ".png",
  type = "ofst",
  BPPARAM = bpparam()
)
```

Arguments

df	an ORFik experiment
outdir	directory to save to (default: NULL, no saving)
scores	scoring function (default: c("sum", "zscore")), see ?coverageScorings for possible scores.
colors	Which colors to use, default auto color from function experiment.colors, new color per library type. Else assign colors yourself.
title	title of ggplot
windowSize	size of binned windows, default: 100
returnPlot	return plot from function, default is.null(outdir), so TRUE if outdir is not defined.
dfr	an ORFik experiment of RNA-seq to normalize against. Will add RNA normalized to plot name if this is done.
idName	A character ID to add to saved name of plot, if you make several plots in the same folder, and same experiment, like splitting transcripts in two groups like targets / nontargets etc. (default: "")
format	default (".png"), do ".pdf" if you want as pdf
type	a character(default: "bedoc"), load files in experiment or some precomputed variant, either "bedo", "bedoc", "pshifted" or default. These are made with ORFik:::simpleLibs(), shiftFootprintsByExperiment().. Will load default if bedoc is not found
BPPARAM	how many cores/threads to use? default: bpparam()

Value

NULL, or ggplot object if returnPlot is TRUE

See Also

Other experiment plots: `transcriptWindowPer()`, `transcriptWindow()`

`transcriptWindowPer` *Helper function for transcriptWindow*

Description

Make 100 bases size meta window for one library in experiment

Usage

```
transcriptWindowPer(
  leaders,
  cds,
  trailers,
  df,
  outdir = NULL,
  scores = c("sum", "zscore"),
  reads,
  returnCoverage = FALSE,
  windowSize = 100,
  BPPARAM = bpparam()
)
```

Arguments

`leaders`	a `GRangesList` of leaders (5' UTRs)
`cds`	a `GRangesList` of coding sequences
`trailers`	a `GRangesList` of trailers (3' UTRs)
`df`	an ORFik `experiment`
`outdir`	directory to save to (default: NULL, no saving)
`scores`	scoring function (default: c("sum", "zscore")), see ?coverageScorings for possible scores.
`reads`	a GRanges / GAligment object of reads, can also be a list of those.
`returnCoverage`	return data.table with coverage (default: FALSE)
`windowSize`	size of binned windows, default: 100
`BPPARAM`	how many cores/threads to use? default: bpparam()

Details

Gives you binned meta coverage plots, either saved seperatly or all in one.

Value

NULL, or ggplot object if returnPlot is TRUE

See Also

Other experiment plots: `transcriptWindow1()`, `transcriptWindow()`

`translationalEff` *Translational efficiency*

Description

Uses RnaSeq and RiboSeq to get translational efficiency of every element in 'grl'. Translational efficiency is defined as:

```
(density of RPF within ORF) / (RNA expression of ORFs transcript)
```

Usage

```
translationalEff(
  grl,
  RNA,
  RFP,
  tx,
  with.fpkm = FALSE,
  pseudoCount = 0,
  librarySize = "full",
  weight.RFP = 1L,
  weight.RNA = 1L
)
```

Arguments

`grl`	a `GRangesList` object can be either transcripts, 5' utrs, cds', 3' utrs or ORFs as a special case (uORFs, potential new cds' etc). If regions are not spliced you can send a `GRanges` object.
`RNA`	RnaSeq reads as `GAlignments`, `GRanges` or GRangesList object
`RFP`	RiboSeq reads as `GAlignments`, `GRanges` or GRangesList object
`tx`	a GRangesList of the transcripts. If you used cage data, then the tss for the the leaders have changed, therefor the tx lengths have changed. To account for that call: ' translationalEff(grl, RNA, RFP, tx = extendLeaders(tx, cageFiveUTRs)) ' where cageFiveUTRs are the reannotated by CageSeq data leaders.
`with.fpkm`	logical, default: FALSE, if true return the fpkm values together with translational efficiency as a data.table
`pseudoCount`	an integer, by default is 0, set it to 1 if you want to avoid NA and inf values.

librarySize	either numeric value or character vector. Default ("full"), number of alignments in library (reads). If you just have a subset, you can give the value by librarySize = length(wholeLib), if you want lib size to be only number of reads overlapping grl, do: librarySize = "overlapping" sum(countOverlaps(reads, grl) > 0), if reads[1] has 3 hits in grl, and reads[2] has 2 hits, librarySize will be 2, not 5. You can also get the inverse overlap, if you want lib size to be total number of overlaps, do: librarySize = "DESeq" This is standard fpkm way of DESeq2::fpkm(robust = FALSE) sum(countOverlaps(grl, reads)) if grl[1] has 3 reads and grl[2] has 2 reads, librarySize is 5, not 2.
weight.RFP	a vector (default: 1L). Can also be character name of column in RFP. As in translationalEff(weight = "score") for: GRanges("chr1", 1, "+", score = 5), would mean score column tells that this alignment region was found 5 times.
weight.RNA	Same as weightRFP but for RNA weights. (default: 1L)

Value

a numeric vector of fpkm ratios, if with.fpkm is TRUE, return a data.table with te and fpkm values (total 3 columns then)

References

doi: 10.1126/science.1168978

See Also

Other features: computeFeaturesCage(), computeFeatures(), countOverlapsW(), disengagementScore(), distToCds(), distToTSS(), entropy(), floss(), fpkm_calc(), fpkm(), fractionLength(), initiationScore(), insideOutsideORF(), isInFrame(), isOverlapping(), kozakSequenceScore(), orfScore(), rankOrder(), ribosomeReleaseScore(), ribosomeStallingScore(), startRegionCoverage(), startRegion(), stopRegion(), subsetCoverage()

Examples

```
ORF <- GRanges(seqnames = "1",
               ranges = IRanges(start = c(1, 10, 20), end = c(5, 15, 25)),
               strand = "+")
grl <- GRangesList(tx1_1 = ORF)
RFP <- GRanges("1", IRanges(25, 25), "+")
RNA <- GRanges("1", IRanges(1, 50), "+")
tx <-  GRangesList(tx1 = GRanges("1", IRanges(1, 50), "+"))
# grl must have same names as cds + _1 etc, so that they can be matched.
te <- translationalEff(grl, RNA, RFP, tx, with.fpkm = TRUE, pseudoCount = 1)
te$fpkmRFP
te$te
```

---

trimming.table *Create trimming table*

Description

From fastp runs in ORFik alignment process

Usage

```
trimming.table(trim_folder)
```

Arguments

trim_folder	folder of trimmed files

Value

a data.table with 4 columns, raw_library (names of library), raw_reads (numeric, number of raw reads), trim_reads (numeric, number of trimmed reads),

---

trim_detection *Add trimming info to QC report*

Description

Only works if alignment was done using ORFik with STAR.

Usage

```
trim_detection(df, finals, out.dir)
```

Arguments

df	an ORFik experiment
finals	a data.table with current output from QCreport
out.dir	optional output directory, default: dirname(df$filepath[1]). Will make a folder called "QC_STATS" with all results in this directory.

Value

a data.table of the update finals object with trim info

---

txNames *Get transcript names from orf names*

Description

Using the ORFik definition of orf name, which is: example ENSEMBL: tx name: ENST0909090909090
orf id: _1 (the first of on that tx) orf_name: ENST0909090909090_1 So therefor txNames("ENST0909090909090_1") = ENST0909090909090

Usage

```
txNames(grl, ref = NULL, unique = FALSE)
```

Arguments

grl	a GRangesList grouped by ORF , GRanges object or IRanges object.
ref	a reference GRangesList. The object you want grl to subset by names. Add to make sure naming is valid.
unique	a boolean, if true unique the names, used if several orfs map to same transcript and you only want the unique groups

Details

The names must be extracted from a column called names, or the names of the grl object. If it is already tx names, it returns the input

NOTE! Do not use _123 etc in end of transcript names if it is not ORFs. Else you will get errors. Just _ will work, but if transcripts are called ENST_123124124000 etc, it will crash, so substitute "_" with "." gsub("_", ".", names)

Value

a character vector of transcript names, without _* naming

See Also

Other ORFHelpers: defineTrailer(), longestORFs(), mapToGRanges(), orfID(), startCodons(), startSites(), stopCodons(), stopSites(), uniqueGroups(), uniqueOrder()

Examples

```
gr_plus <- GRanges(seqnames = c("chr1", "chr1"),
                   ranges = IRanges(c(7, 14), width = 3),
                   strand = c("+", "+"))
gr_minus <- GRanges(seqnames = c("chr2", "chr2"),
                    ranges = IRanges(c(4, 1), c(9, 3)),
                    strand = c("-", "-"))
grl <- GRangesList(tx1_1 = gr_plus, tx2_1 = gr_minus)
# there are 2 orfs, both the first on each transcript
txNames(grl)
```

---

txNamesToGeneNames *Convert transcript names to gene names*

Description

Works for ensembl, UCSC and other standard annotations.

Usage

```
txNamesToGeneNames(txNames, txdb)
```

Arguments

txNames	character vector, the transcript names to convert. Can also be a named object with tx names (like a GRangesList), will then extract names.
txdb	the transcript database to use or gtf/gff path to it.

Value

character vector of gene names

Examples

```
gtf <- system.file("extdata", "annotations.gtf", package = "ORFik")
txdb <- loadTxdb(gtf)
loadRegions(txdb, "cds") # using tx names
txNamesToGeneNames(cds, txdb)
# Identical to:
loadRegions(txdb, "cds", by = "gene")
```

---

txSeqsFromFa *Get transcript sequence from a GrangesList and a faFile or BSgenome*

Description

For each GRanges object, find the sequence of it from faFile or BSgenome.

Usage

```
txSeqsFromFa(grl, faFile, is.sorted = FALSE, keep.names = TRUE)
```

Arguments

grl	a GRangesList object
faFile	FaFile, BSgenome, fasta/index file path or an ORFik experiment. This file is usually used to find the transcript sequences from some GRangesList.
is.sorted	a speedup, if you know the grl ranges are sorted
keep.names	a logical, default (TRUE), if FALSE: return as character vector without names.

Details

A wrapper around extractTranscriptSeqs that works for ORFik experiment input. For debug of errors do: which(!(unique(seqnamesPerGroup(grl, FALSE)) This happens usually when the grl contains chromsomes that the fasta file does not have. A normal error is that mitocondrial chromosome is called MT vs chrM even though they have same seqlevelsStyle. The above line will give you which chromosome it is missing.

Value

a DNAStringSet of the transcript sequences

See Also

Other ExtendGenomicRanges: asTX(), coveragePerTiling(), extendLeaders(), extendTrailers(), reduceKeepAttr(), tile1(), windowPerGroup()

uniqueGroups *Get the unique set of groups in a GRangesList*

Description

Sometimes GRangesList groups might be identical, for example ORFs from different isoforms can have identical ranges. Use this function to reduce these groups to unique elements in GRangesList grl, without names and metacolumns.

Usage

```
uniqueGroups(grl)
```

Arguments

grl	a GRangesList

Value

a GRangesList of unique orfs

See Also

Other ORFHelpers: defineTrailer(), longestORFs(), mapToGRanges(), orfID(), startCodons(), startSites(), stopCodons(), stopSites(), txNames(), uniqueOrder()

Examples

```
gr1 <- GRanges("1", IRanges(1,10), "+")
gr2 <- GRanges("1", IRanges(20, 30), "+")
# make a grl with duplicated ORFs (gr1 twice)
grl <- GRangesList(tx1_1 = gr1, tx2_1 = gr2, tx3_1 = gr1)
uniqueGroups(grl)
```

uniqueOrder *Get unique ordering for GRangesList groups*

Description

This function can be used to calculate unique numerical identifiers for each of the GRangesList elements. Elements of GRangesList are unique when the GRanges inside are not duplicated, so ranges differences matter as well as sorting of the ranges.

Usage

```
uniqueOrder(grl)
```

Arguments

grl	a GRangesList

Value

an integer vector of indices of unique groups

See Also

uniqueGroups

Other ORFHelpers: defineTrailer(), longestORFs(), mapToGRanges(), orfID(), startCodons(), startSites(), stopCodons(), stopSites(), txNames(), uniqueGroups()

Examples

```
gr1 <- GRanges("1", IRanges(1,10), "+")
gr2 <- GRanges("1", IRanges(20, 30), "+")
# make a grl with duplicated ORFs (gr1 twice)
grl <- GRangesList(tx1_1 = gr1, tx2_1 = gr2, tx3_1 = gr1)
uniqueOrder(grl) # remember ordering

# example on unique ORFs
uniqueORFs <- uniqueGroups(grl)
# now the orfs are unique, let's map back to original set:
reMappedGrl <- uniqueORFs[uniqueOrder(grl)]
```

---

unlistGrl *Safe unlist*

Description

Same as [AnnotationDbi::unlist2()], keeps names correctly. Two differences is that if grl have no names, it will not make integer names, but keep them as null. Also if the GRangesList has names , and also the GRanges groups, then the GRanges group names will be kept.

Usage

```
unlistGrl(grl)
```

Arguments

grl	a GRangesList

Value

a GRanges object

Examples

```
ORF <- GRanges(seqnames = "1",
               ranges = IRanges(start = c(1, 10, 20),
                                end = c(5, 15, 25)),
               strand = "+")
grl <- GRangesList(tx1_1 = ORF)
unlistGrl(grl)
```

uORFSearchSpace *Create search space to look for uORFs*

Description

Given a GRangesList of 5' UTRs or transcripts, reassign the start sites using max peaks from CageSeq data (if CAGE is given). A max peak is defined as new TSS if it is within boundary of 5' leader range, specified by 'extension' in bp. A max peak must also be higher than minimum CageSeq peak cutoff specified in 'filterValue'. The new TSS will then be the positioned where the cage read (with highest read count in the interval). If you want to include uORFs going into the CDS, add this argument too.

Usage

```
uORFSearchSpace(
  fiveUTRs,
  cage = NULL,
  extension = 1000,
  filterValue = 1,
  restrictUpstreamToTx = FALSE,
  removeUnused = FALSE,
  cds = NULL
)
```

Arguments

fiveUTRs	(GRangesList) The 5' leaders or full transcript sequences
cage	Either a filePath for the CageSeq file as .bed .bam or .wig, with possible compressions (".gzip", ".gz", ".bgz"), or already loaded CageSeq peak data as GRanges or GAlignment. NOTE: If it is a .bam file, it will add a score column by running: convertToOneBasedRanges(cage, method = "5prime", addScoreColumn = TRUE) The score column is then number of replicates of read, if score column is something else, like read length, set the score column to NULL first.
extension	The maximum number of basses upstream of the TSS to search for CageSeq peak.
filterValue	The minimum number of reads on cage position, for it to be counted as possible new tss. (represented in score column in CageSeq data) If you already filtered, set it to 0.
restrictUpstreamToTx	a logical (FALSE). If TRUE: restrict leaders to not extend closer than 5 bases from closest upstream leader, set this to TRUE.
removeUnused	logical (FALSE), if False: (standard is to set them to original annotation), If TRUE: remove leaders that did not have any cage support.
cds	(GRangesList) CDS of relative fiveUTRs, applicable only if you want to extend 5' leaders downstream of CDS's, to allow upstream ORFs that can overlap into CDS's.

Value

a GRangesList of newly assigned TSS for fiveUTRs, using CageSeq data.

See Also

Other uorfs: addCdsOnLeaderEnds(), filterUORFs(), removeORFsWithSameStartAsCDS(), removeORFsWithSameSt
removeORFsWithStartInsideCDS(), removeORFsWithinCDS()

Examples

```
# example 5' leader, notice exon_rank column
fiveUTRs <- GenomicRanges::GRangesList(
  GenomicRanges::GRanges(seqnames = "chr1",
                         ranges = IRanges::IRanges(1000, 2000),
                         strand = "+",
                         exon_rank = 1))
names(fiveUTRs) <- "tx1"

# make fake CageSeq data from promoter of 5' leaders, notice score column
cage <- GenomicRanges::GRanges(
  seqnames = "chr1",
  ranges =  IRanges::IRanges(500, 510),
  strand = "+",
  score = 10)

# finally reassign TSS for fiveUTRs
uORFSearchSpace(fiveUTRs, cage)
```

---

updateTxdbRanks *Update exon ranks of exon data.frame inside txdb object*

Description

Update exon ranks of exon data.frame inside txdb object

Usage

```
updateTxdbRanks(exons)
```

Arguments

exons	a data.frame, call of as.list(txdb)$splicings

Value

a data.frame, modified call of as.list(txdb)

updateTxdbStartSites *Update start sites of leaders*

Description

Update start sites of leaders

Usage

```
updateTxdbStartSites(txList, fiveUTRs, removeUnused)
```

Arguments

txList	a list, call of as.list(txdb)
fiveUTRs	a GRangesList of 5' leaders
removeUnused	logical (FALSE), remove leaders that did not have any cage support. (standard is to set them to original annotation)

Value

a list, modified call of as.list(txdb)

upstreamFromPerGroup *Get rest of objects upstream (inclusive)*

Description

Per group get the part upstream of position. upstreamFromPerGroup(tx, stopSites(fiveUTRs, asGR = TRUE)) will return the 5' utrs per transcript as GRangesList, usually used for interesting parts of the transcripts.

Usage

```
upstreamFromPerGroup(tx, upstreamFrom)
```

Arguments

tx	a GRangesList, usually of Transcripts to be changed
upstreamFrom	a vector of integers, for each group in tx, where is the new start point of first valid exon.

Details

If you don't want to include the points given in the region, use upstreamOfPerGroup

Value

a GRangesList of upstream part

See Also

Other GRanges: assignFirstExonsStartSite(), assignLastExonsStopSite(), downstreamFromPerGroup(), downstreamOfPerGroup(), upstreamOfPerGroup()

---

upstreamOfPerGroup *Get rest of objects upstream (exclusive)*

Description

Per group get the part upstream of position upstreamOfPerGroup(tx, startSites(cds, asGR = TRUE)) will return the 5' utrs per transcript, usually used for interesting parts of the transcripts.

Usage

```
upstreamOfPerGroup(
  tx,
  upstreamOf,
  allowOutside = TRUE,
  is.circular = all(isCircular(tx) %in% TRUE)
)
```

Arguments

tx	a GRangesList, usually of Transcripts to be changed
upstreamOf	a vector of integers, for each group in tx, where is the the base after the new stop point of last valid exon.
allowOutside	a logical (T), can upstreamOf extend outside range of tx, can set boundary as a false hit, so beware.
is.circular	logical, default FALSE if not any is: all(isCircular(grl) Where grl is the ranges checked. If TRUE, allow ranges to extend below position 1 on chromosome. Since circular genomes can have negative coordinates.

Value

a GRangesList of upstream part

See Also

Other GRanges: assignFirstExonsStartSite(), assignLastExonsStopSite(), downstreamFromPerGroup(), downstreamOfPerGroup(), upstreamFromPerGroup()

validateExperiments *Validate ORFik experiment*

Description

Check for valid existing, non-empty and all unique. A good way to see if your experiment is valid.

Usage

```
validateExperiments(df)
```

Arguments

df	an ORFik experiment

Value

NULL (Stops if failed)

See Also

Other ORFik_experiment: ORFik.template.experiment(), bamVarName(), create.experiment(), experiment-class, filepath(), libraryTypes(), organism.df(), outputLibs(), read.experiment(), save.experiment()

validGRL *Helper Function to check valid GRangesList input*

Description

Helper Function to check valid GRangesList input

Usage

```
validGRL(class, type = "grl", checkNULL = FALSE)
```

Arguments

class	as character vector the given class of supposed GRangesList object
type	a character vector, is it gtf, cds, 5', 3', for messages.
checkNULL	should NULL classes be checked and return indeces of these?

Value

either NULL or indices (checkNULL == TRUE)

See Also

Other validity: checkRFP(), checkRNA(), is.ORF(), is.gr_or_grl(), is.grl(), is.range(), validSeqlevels()

validSeqlevels *Helper function to find overlaping seqlevels*

Description

Keep only seqnames in reads that are in grl Useful to avoid seqname warnings in bioC

Usage

```
validSeqlevels(grl, reads)
```

Arguments

grl	a GRangesList or GRanges object
reads	a GRanges, GAlignment or GAlignmentPairs object

Value

a character vector of valid seqlevels

See Also

Other validity: checkRFP(), checkRNA(), is.ORF(), is.gr_or_grl(), is.grl(), is.range(), validGRL()

widthPerGroup *Get list of widths per granges group*

Description

Get list of widths per granges group

Usage

```
widthPerGroup(grl, keep.names = TRUE)
```

Arguments

grl	a GRangesList
keep.names	a boolean, keep names or not, default: (TRUE)

Value

an integer vector (named/unnamed) of widths

Examples

```
gr_plus <- GRanges(seqnames = c("chr1", "chr1"),
                   ranges = IRanges(c(7, 14), width = 3),
                   strand = c("+", "+"))
gr_minus <- GRanges(seqnames = c("chr2", "chr2"),
                    ranges = IRanges(c(4, 1), c(9, 3)),
                    strand = c("-", "-"))
grl <- GRangesList(tx1 = gr_plus, tx2 = gr_minus)
widthPerGroup(grl)
```

`windowCoveragePlot` *Get meta coverage plot of reads*

Description

Spanning a region like a transcripts, plot how the reads distribute.

Usage

```
windowCoveragePlot(
  coverage,
  output = NULL,
  scoring = "zscore",
  colors = c("skyblue4", "orange"),
  title = "Coverage metaplot",
  type = "transcripts",
  scaleEqual = FALSE,
  setMinToZero = FALSE
)
```

Arguments

`coverage`	a data.table, e.g. output of scaledWindowCoverage
`output`	character string (NULL), if set, saves the plot as pdf or png to path given. If no format is given, is save as pdf.
`scoring`	character vector, default "zscore", either of zscore, transcriptNormalized, sum, mean, median, .. or NULL. Set NULL if already scored. see ?coverageScorings for info and more alternatives.
`colors`	character vector colors to use in plot, will fix automaticly, using binary splits with colors c('skyblue4', 'orange').
`title`	a character (metaplot) (what is the title of plot?)
`type`	a character (transcripts), what should legends say is the whole region? Transcripts, genes, non coding rnas etc.
`scaleEqual`	a logical (FALSE), should all fractions (rows), have same max value, for easy comparison of max values if needed.
`setMinToZero`	a logical (FALSE), should minimum y-value be 0 (TRUE). With FALSE minimum value is minimum score at any position. This parameter overrides scaleEqual.

Details

If coverage has a column called feature, this can be used to subdivide the meta coverage into parts as (5' UTRs, cds, 3' UTRs) These are the columns in the plot. The fraction column divide sequence libraries. Like ribo-seq and rna-seq. These are the rows of the plot. If you return this function without assigning it and output is NULL, it will automaticly plot the figure in your session. If output is assigned, no plot will be shown in session. NULL is returned and object is saved to output.

Colors: Remember if you want to change anything like colors, just return the ggplot object, and reassign like: obj + scale_color_brewer() etc.

Value

a ggplot object of the coverage plot, NULL if output is set, then the plot will only be saved to location.

See Also

Other coveragePlot: `coverageHeatMap()`, `pSitePlot()`, `savePlot()`

Examples

```
library(data.table)
coverage <- data.table(position = seq(20),
                       score = sample(seq(20), 20, replace = TRUE))
windowCoveragePlot(coverage)

#Multiple plots in one frame:
coverage2 <- copy(coverage)
coverage$fraction <- "Ribo-seq"
coverage2$fraction <- "RNA-seq"
dt <- rbindlist(list(coverage, coverage2))
windowCoveragePlot(dt, scoring = "log10sum")

# See vignette for a more practical example
```

---

windowPerGroup *Get window region of GRanges object*

Description

Per GRanges input (gr) of single position inputs, create a GRangesList window output of specified upstream, downstream region relative to some transcript "tx".
If downstream is 20, it means the window will start 20 downstream of gr start site (-20 in relative transcript coordinates.) If upstream is 20, it means the window will start 20 upstream of gr start site (+20 in relative transcript coordinates.) It will keep exon structure of tx, so if -20 is on next exon, it jumps to next exon.

Usage

```
windowPerGroup(gr, tx, upstream = 0L, downstream = 0L)
```

Arguments

gr	a GRanges/IRanges object (startSites or others, must be single point per in genomic coordinates)
tx	a GRangesList of transcripts or (container region), names of tx must contain all gr names. The names of gr can also be the ORFik orf names. that is "txName_id".
upstream	an integer, default (0), relative region to get upstream from.
downstream	an integer, default (0), relative region to get downstream from

Details

If a region has a part that goes out of bounds, E.g if you try to get window around the CDS start site, goes longer than the 5' leader start site, it will set start to the edge boundary (the TSS of the transcript in this case). If region has no hit in bound, a width 0 GRanges object is returned. This is useful for things like countOverlaps, since 0 hits will then always be returned for the correct object index. If you don't want the 0 width windows, use `reduce()` to remove 0-width windows.

Value

a GRanges, or GRangesList object if any group had > 1 exon.

See Also

Other ExtendGenomicRanges: `asTX()`, `coveragePerTiling()`, `extendLeaders()`, `extendTrailers()`, `reduceKeepAttr()`, `tile1()`, `txSeqsFromFa()`

Examples

```
# find 2nd codon of an ORF on a spliced transcript
ORF <- GRanges("1", c(3), "+") # start site
names(ORF) <- "tx1_1" # ORF 1 on tx1
tx <- GRangesList(tx1 = GRanges("1", c(1,3,5,7,9,11,13), "+"))
windowPerGroup(ORF, tx, upstream = -3, downstream = 5) # <- 2nd codon

# With multiple extensions downstream
ORF <- rep(ORF, 2)
names(ORF)[2] <- "tx1_2"
windowPerGroup(ORF, tx, upstream = 0, downstream = c(3, 5))
```

---

windowPerReadLength *Find proportion of reads per position per read length in window*

Description

This is defined as: Fraction of reads per read length, per position in whole window (defined by upstream and downstream) If tx is not NULL, it gives a metaWindow, centered around startSite of grl from upstream and downstream. If tx is NULL, it will use only downstream , since it has no reference on how to find upstream region. The exception is when upstream is negative, that is, going into downstream region of the object.

Usage

```
windowPerReadLength(
  grl,
  tx = NULL,
  reads,
  pShifted = TRUE,
  upstream = if (pShifted) 5 else 20,
  downstream = if (pShifted) 20 else 5,
  acceptedLengths = NULL,
  zeroPosition = upstream,
  scoring = "transcriptNormalized",
  weight = "score"
)
```

Arguments

grl	a GRangesList object with usually either leaders, cds', 3' utrs or ORFs
tx	default NULL, a GRangesList of transcripts or (container region), names of tx must contain all grl names. The names of grl can also be the ORFik orf names. that is "txName_id"
reads	a GAlignments or GRanges object of RiboSeq, RnaSeq etc. Weigths for scoring is default the 'score' column in 'reads'
pShifted	a logical (TRUE), are Ribo-seq reads p-shifted to size 1 width reads? If upstream and downstream is set, this argument is irrelevant. So set to FALSE if this is not p-shifted Ribo-seq.
upstream	an integer (5), relative region to get upstream from.
downstream	an integer (20), relative region to get downstream from
acceptedLengths	an integer vector (NULL), the read lengths accepted. Default NULL, means all lengths accepted.
zeroPosition	an integer DEFAULT (upstream), what is the center point? Like leaders and cds combination, then 0 is the TIS and -1 is last base in leader. NOTE!: if windows have different widths, this will be ignored.
scoring	a character (transcriptNormalized), which meta coverage scoring ? one of (zscore, transcriptNormalized, mean, median, sum, sumLength, fracPos), see ?coverageScorings for more info. Use to decide a scoring of hits per position for metacoverage etc. Set to NULL if you do not want meta coverage, but instead want per gene per position raw counts.
weight	(default: 'score'), if defined a character name of valid meta column in subject. GRanges("chr1", 1, "+", score = 5), would mean score column tells that this alignment region was found 5 times. ORFik .bedo files, contains a score column like this. As do CAGEr CAGE files and many other package formats. You can also assign a score column manually.

Value

a data.table with lengths by coverage / vector of proportions

See Also

Other coverage: coverageScorings(), metaWindow(), regionPerReadLength(), scaledWindowPositions()

Examples

```
cds <- GRangesList(tx1 = GRanges("1", 100:129, "+"))
tx <- GRangesList(tx1 = GRanges("1", 80:129, "+"))
reads <- GRanges("1", seq(79,129, 3), "+")
windowPerReadLength(cds, tx, reads, scoring = "sum")
windowPerReadLength(cds, tx, reads, scoring = "transcriptNormalized")
```

`windowPerTranscript` *Get a binned coverage window per transcript*

Description

Per transcript (or other regions), bin them all to windowSize (default 100), and make a data.table, rows are positions, useful for plotting with ORFik and ggplot2.

Usage

```
windowPerTranscript(
  txdb,
  reads,
  splitIn3 = TRUE,
  windowSize = 100,
  fraction = "1",
  weight = "score",
  BPPARAM = bpparam()
)
```

Arguments

`txdb`	a TxDb object or a path to gtf/gff/db file.
`reads`	GRanges or GAlignment of reads
`splitIn3`	a logical(TRUE), split window in 3 (leader, cds, trailer)
`windowSize`	an integer (100), size of windows (columns)
`fraction`	a character (1), info on reads (which read length, or which type (RNA seq)) (row names)
`weight`	(default: 'score'), if defined a character name of valid meta column in subject. GRanges("chr1", 1, "+", score = 5), would mean score column tells that this alignment region was found 5 times. ORFik .bedo files, contains a score column like this. As do CAGEr CAGE files and many other package formats. You can also assign a score column manually.
`BPPARAM`	how many cores/threads to use? default: bpparam()

Details

NOTE: All ranges with smaller width than windowSize, will of course be removed. What is the 100th position on a 1 width object ?

Value

a data.table with columns position, score

xAxisScaler *Scale x axis correctly*

Description

Works for all coverage plots, that need 0 position aligning

Usage

```
xAxisScaler(covPos)
```

Arguments

covPos	a numeric vector of positions in coverage

Details

It basicly bins the x axis on floor(length of x axis / 20) or 1 if x < 20

Value

a numeric vector from the seq() function, aligned to 0.

yAxisScaler *Scale y axis correctly*

Description

Works for all coverage plots.

Usage

```
yAxisScaler(covPos, increments.y = "auto")
```

Arguments

covPos	a levels object from a factor of y axis
increments.y	increments of y axis, default "auto". Or a numeric value < max position & > min position.

Value

a character vector from the seq() function, aligned to 0.

Index
