

Package ‘synapterdata’

October 18, 2017

Type Package

Title Data accompanying the synapter package

Version 1.14.0

Author Laurent Gatto, Sebastian Gibb and Pavel V. Shliaha

Maintainer Laurent Gatto <lg390@cam.ac.uk>

Description Data independant acquisition of UPS1 protein mix in an *E. coli* background obtained on a Waters Synapt G2 instrument.

Depends R (>= 2.10), synapter (>= 1.99.2)

Imports utils

License GPL-2

synapterdata-package *Data accompanying the synapter package*

Description

Data independant acquisition of UPS1 protein mix in an *E. coli* background obtained on a Waters Synapt G2 instrument.

Details

See the synapter package for details.

Index:

getHDMSeFinalPeptide	PLGS csv data and fasta files
getMaster	Get <code>_master_</code> HDMSe data
ups25a	'Synapter' spiked-in example data.

Author(s)

getHDMSeFinalPeptide *PLGS csv data and fasta files*

Description

The PLGS HDMSe final peptide, MSe final peptide and MSe Pep3D output files are provided as gzipped csv files and their respective full paths can be obtained with `getHDMSeFinalPeptide`, `getMSeFinalPeptide` and `getMSePep3D`. These can then be used directly in the respective synapter functions and methods, as `read.csv` automatically uncompressed the files.

The fasta database file is also available in as a gnuzip archive. Fasta file are however not automatically handled in gzipped format. `getFasta` first decompresses the file in a temporary directory and returns the full path to that uncompressed file.

Usage

```
getHDMSeFinalPeptide()  
getMSeFinalPeptide()  
getMSePep3D()  
getFasta()
```

Examples

```
getHDMSeFinalPeptide()
```

`getMaster`*Get master HDMSe data*

Description

TODO A concise (1-5 lines) description of what the function does.

Usage

```
getMaster()  
loadMaster()
```

Details

TODO If necessary, more details than the description above

[ups25a](#) and [getHDMSeFinalPeptide](#)

Examples

```
loadMaster()  
master
```

`synobj2`*Example Synapter object*

Description

An instance of class `Synapter` used to demonstrate ion mobility separation and peak matching in the respective synapter vignettes. The object can be created using the files available at <http://proteome.sysbio1.cam.ac.uk/lgatto/synapter/data/> and the script `create_synobj2.R` in `system.file("scripts", package = "synapterdata")`.

Use `synobj2RData` to load it.

Usage

```
data(synobj2)  
synobj2RData()
```

Format

An instance of class Synapter.

Examples

```
synobj2RData()  
synobj2
```

ups25a

Synapter *spiked-in example data.*

Description

Objects of class Synapter, implented in the synapter package. The 6 instances represent triplicate run of the Universal Proteomics Standard (UPS1) 48 protein mix in an E. coli background, spiked in at 25 and 50 femtomoles.

Usage

```
data(ups25c)
```

Details

Each instance has been created with the `synergise` function. The respective MSe final peptide and MSe Pep3D final are also provided in the package (see [getMSeFinalPeptide](#) and [getMSePep3D](#)). The identification peptides is a master HDMSe file (see [getMaster](#)). The code generating the instances is available in the `synergise.R R` file, in the `scripts` package directory.
