

Package ‘CexoR’

April 5, 2014

Version 1.0.0

Date 2013-09-09

Type Package

Title An R package to uncover high-resolution protein-DNA interactions in ChIP-exo replicates

Author Pedro Madrigal <pm@engineering.com>

Description Strand specific peak-pair calling in ChIP-exo replicates. The cumulative Skellam distribution function (package 'skellam') is used to detect significant normalized count differences of opposed sign at each DNA strand (peak-pairs). Irreproducible discovery rate for overlapping peak-pairs across biological replicates is estimated using the package 'idr'.

Depends R (>= 2.10.0), IRanges

Maintainer Pedro Madrigal <pm@engineering.com>

Imports Rsamtools, GenomicRanges, rtracklayer, idr

Suggests RUnit, BiocGenerics

Examples

```
## hg19. chr2:1-1,000,000. CTCF data from Rhee and Pugh (2011)

owd <- setwd(tempdir())

rep1 <- "CTCF_rep1_chr2_1-1e6.bam"
rep2 <- "CTCF_rep2_chr2_1-1e6.bam"
```

```

rep3 <- "CTCF_rep3_chr2_1-1e6.bam"
r1 <- system.file("extdata", rep1, package="CexoR", mustWork = TRUE)
r2 <- system.file("extdata", rep2, package="CexoR", mustWork = TRUE)
r3 <- system.file("extdata", rep3, package="CexoR", mustWork = TRUE)

cexor(bam=c(r1,r2,r3), chrN="chr2", chrL=1e6, idr=0.01, p=1e-12, N=3e4)

setwd(owd)

```

cexor*ChIP-exo peak-pair calling***Description**

ChIP-exo peak-pair calling.

Usage

```
cexor(bam, chrN, chrL, p=1e-12, dpeaks=c(0,150), dpairs=100, idr=0.01,
N=5e6, bedfile=TRUE)
```

Arguments

<code>bam</code>	BAM alignment files of biological replicates.
<code>chrN</code>	Vector of chromosome names.
<code>chrL</code>	Vector of chromosome sizes (bp).
<code>p</code>	P-value cutoff (should be relaxed to allow the correct estimation of the irreproducible discovery rate (idr). See the vignette for more information.)
<code>dpeaks</code>	Main. and max. allowed distance between peak pairs located at opposed strands in a replicate (bp).
<code>dpairs</code>	Max. allowable distance between peak-pair centres across replicates (bp).
<code>idr</code>	Irreproducible discovery rate cutoff [0-1].
<code>N</code>	Genome is divided in blocks of N bp. for processing. N must be not higher than the size of the smallest chromosome.
<code>bedfile</code>	Generate BED files of ChIP-exo reproducible peak pairs.

Details

Strand specific peak-pair calling in ChIP-exo replicates. The cumulative Skellam distribution function (package 'skellam') is used to detect significant normalized count differences of opposed sign at each DNA strand (peak-pairs). Irreproducible discovery rate for overlapping peak-pairs across biological replicates is estimated using the package 'idr'. The internal functions `pskellam` and `pskellam.sp` from the Jerry W. Lewis' 'skellam' R package (version 0.0-8-7) are used to calculate the cumulative Skellam distribution (see LICENSE file).

Value

A list containing the following elements:

- bindingEvents** A GRanges object with reproducible peak pair locations. The metadata 'value' indicates the Irreproducible discovery rate (IDR) estimated at this region.
- bindingCentres** A GRanges object with centre position of reproducible peak pair locations. The metadata 'value' indicates the Irreproducible discovery rate (IDR) estimated at this region.
- pairedPeaksRepl**
A GRangesList object with the location of peak pairs retrieved at each replicate. The metadata 'score' indicates -log10(p-value).
