biocViews GeneRegulation, Sequencing, WorkflowStep, CRISPR

Suggests knitr, RUnit, BiocStyle, BSgenome.Hsapiens.UCSC.hg19,
TxDb.Hsapiens.UCSC.hg19.knownGene, org.Hs.eg.db

VignetteBuilder knitr

Description The package implements GUIDE-seq analysis workflow
including functions for obtaining unique insertion
sites (proxy of cleavage sites), estimating the locations
of the insertion sites, aka, peaks, merging estimated insertion
sites from plus and minus strand, and performing off target
search of the extended regions around insertion sites.

R topics documented:

GUIDEseq-package   *Analysis of GUIDE-seq*

Description

The package includes functions to retain one read per unique molecular identifier (UMI), filter
reads lacking integration oligo sequence, identify peak locations (cleavage sites) and heights, merge
peaks, perform off-target search using the input gRNA. This package leverages CRISPRseek and
ChIPpeakAnno packages.

Details

Package:	GUIDEseq
Type:	Package
Version:	1.0
Date:	2015-09-04
License:	GPL (>= 2)

Function GUIDEseqAnalysis integrates all steps of GUIDE-seq analysis into one function call

Examples

```
if(interactive())
{
    library("BSgenome.Hsapiens.UCSC.hg19")
    umiFile <- system.file("extdata", "UMI-HEK293_site4_chr13.txt",
        package = "GUIDEseq")
    alignFile <- system.file("extdata","bowtie2.HEK293_site4_chr13.sort.bam" ,
        package = "GUIDEseq")
    gRNA.file <- system.file("extdata","gRNA.fa", package = "GUIDEseq")
    guideSeqRes <- GUIDEseqAnalysis(
        alignment.inputfile = alignFile,
        umi.inputfile = umiFile, gRNA.file = gRNA.file,
        orderOfftargetsBy = "peak_score",
        descending = TRUE,
        keepTopOfftargetsBy = "predicted_cleavage_score",
        scoring.method = "CFDscore",
        BSgenomeName = Hsapiens, min.reads = 80, n.cores.max = 1)
    guideSeqRes$offTargets
}
```

---

annotateOffTargets   *Annotate offtargets with gene name*

Description

Annotate offtargets with gene name and whether it is inside an exon

Usage

```
annotateOffTargets(thePeaks, txdb, orgAnn)
```

Arguments

thePeaks	Output from offTargetAnalysisOfPeakRegions
txdb	TxDb object, for creating and using TxDb object, please refer to GenomicFeatures package. For a list of existing TxDb object, please search for annotation package starting with Txdb at http://www.bioconductor.org/packages/release/BiocViews.html#___An such as TxDb.Rnorvegicus.UCSC.rn5.refGene for rat, TxDb.Mmusculus.UCSC.mm10.knownGene for mouse, TxDb.Hsapiens.UCSC.hg19.knownGene for human, TxDb.Dmelanogaster.UCSC.dm3.en for Drosophila and TxDb.Celegans.UCSC.ce6.ensGene for C.elegans
orgAnn	organism annotation mapping such as org.Hs.egSYMBOL in org.Hs.eg.db package for human

Value

A data frame and a tab-delimited file offTargetsInPeakRegions.xls, containing all input offtargets with potential gRNA binding sites, mismatch number and positions, alignment to the input gRNA and predicted cleavage score, and whether the offtargets are inside an exon and associated gene name.

        orderOfftargetsBy = "predicted_cleavage_score",
        PAM = "NGG", PAM.pattern = "(NGG|NAG|NGA)$", max.mismatch = 2L,
        outputDir = outputDir,
        allowed.mismatch.PAM = 3, overwrite = TRUE)
    annotatedOfftargets <- annotateOffTargets(offTargets,
        txdb = TxDb.Hsapiens.UCSC.hg19.knownGene,
        orgAnn = org.Hs.egSYMBOL)
}
```

---

combineOfftargets   *Combine Offtargets*

Description

Merge offtargets from different samples

Usage

```
combineOfftargets(offtarget.folder, sample.name,
    remove.common.offtargets = FALSE,control.sample.name,
    offtarget.filename = "offTargetsInPeakRegions.xls",
    common.col = c("offTarget","predicted_cleavage_score",
        "gRNA.name", "gRNAPlusPAM", "offTarget_sequence",
        "guideAlignment2OffTarget", "offTargetStrand",
        "mismatch.distance2PAM", "n.PAM.mismatch",
        "n.guide.mismatch", "PAM.sequence", "offTarget_Start",
         "offTarget_End", "chromosome"),
    exclude.col,
    outputFileName)
```

Arguments

offtarget.folder

offtarget summary output folders created in GUIDEseqAnalysis function

sample.name	Sample names to be used as part of the column names in the final output file
remove.common.offtargets	
	Default to FALSE If set to TRUE, off-targets common to all samples will be removed.
control.sample.name	
	The name of the control sample for filtering off-targets present in the control sample
offtarget.filename	
	Default to offTargetsInPeakRegions.xls, generated in GUIDEseqAnalysis function
common.col	common column names used for merge files. Default to c("offTarget","predicted_cleavage_score", "gRNA.name", "gRNAPlusPAM", "offTarget_sequence", "guideAlignment2OffTarget", "offTargetStrand", "mismatch.distance2PAM", "n.PAM.mismatch", "n.guide.mismatch", "PAM.sequence", "offTarget_Start", "offTarget_End", "chromosome")
exclude.col	columns to be excluded before merging. Please check offTargetsInPeakRegions.xls to choose the desired columns to exclude
outputFileName	The merged offtarget file

Details

Please note that by default, merged file will only contain peaks with offtargets found in the genome in GUIDEseqAnalysis function.

Value

a tab-delimited file similar to offTargetsInPeakRegions.tsv, containing all peaks from all samples merged by potential gRNA binding sites, mismatch number and positions, alignment to the input gRNA and predicted cleavage score. Sample specific columns have sample.name concatenated to the original column name, e.g., peak_score becomes sample1.peak_score.

Author(s)

Lihua Julie Zhu

Examples

```
offtarget.folder <- system.file("extdata",
    c("sample1-17", "sample2-18", "sample3-19"),
    package = "GUIDEseq")
mergedOfftargets <-
    combineOfftargets(offtarget.folder = offtarget.folder,
    sample.name = c("cas9Only", "WT SpCas9", "SpCas9-MT3-ZFP"),
    outputFileName = "TS2offtargets3Constructs.xls")
```

createBarcodeFasta	*Create barcode as fasta file format for building bowtie1 index*

Description

Create barcode as fasta file format for building bowtie1 index to assign reads to each library with different barcodes. The bowtie1 index has been built for the standard GUIDE-seq protocol using the standard p5 and p7 index. It can be downloaded at http://mccb.umassmed.edu/GUIDE-seq/barcode.bowtie1.index.tar.gz

Usage

```
createBarcodeFasta(p5.index, p7.index, reverse.p7 = TRUE,
    reverse.p5 = FALSE, header = FALSE, outputFile = "barcodes.fa")
```

Arguments

p5.index	A text file with one p5 index sequence per line
p7.index	A text file with one p7 index sequence per line
header	Indicate whether there is a header in the p5.index and p7.index files. Default to FALSE
reverse.p7	Indicate whether to reverse p7 index, default to TRUE for standard GUIDE-seq experiments
reverse.p5	Indicate whether to reverse p5 index, default to FALSE for standard GUIDE-seq experiments
outputFile	Give a name to the output file where the generated barcodes are written. This file can be used to build bowtie1 index for binning reads.

Note

Create barcode file to be used to bin the reads sequenced in a pooled lane

Author(s)

Lihua Julie Zhu

Examples

```
    p7 <- system.file("extdata", "p7.index",
        package = "GUIDEseq")
    p5 <- system.file("extdata", "p5.index",
        package = "GUIDEseq")
    outputFile <- "barcodes.fa"
    createBarcodeFasta(p5.index = p5, p7.index = p7, reverse.p7 = TRUE,
        reverse.p5 = FALSE, outputFile = outputFile)
```

---

getPeaks   *Obtain peaks from GUIDE-seq*

Description

Obtain strand-specific peaks from GUIDE-seq

Usage

```
getPeaks(gr, window.size = 20L, step = 20L, bg.window.size = 5000L,
    min.reads = 10L, min.SNratio = 2, maxP = 0.05,
    stats = c("poisson", "nbinom"), p.adjust.methods =
    c("none", "BH", "holm", "hochberg", "hommel", "bonferroni", "BY", "fdr"))
```

Arguments

gr	GRanges with cleavage sites, output from getUniqueCleavageEvents
window.size	window size to calculate coverage
step	step size to calculate coverage
bg.window.size	window size to calculate local background
min.reads	minimum number of reads to be considered as a peak
min.SNratio	minimum signal noise ratio, which is the coverage normalized by local background
maxP	Maximum p-value to be considered as significant
stats	Statistical test, default poisson
p.adjust.methods	
	Adjustment method for multiple comparisons, default none

Value

peaks	GRanges with count (peak height), bg (local background), SNratio (signal noise ratio), p-value, and option adjusted p-value
summarized.count	
	A data frame contains the same information as peaks except that it has all the sites without filtering.

Author(s)

Lihua Julie Zhu

Examples

```
if (interactive())
{
    data(uniqueCleavageEvents)
    peaks <- getPeaks(uniqueCleavageEvents$cleavage.gr,
        min.reads = 80)
    peaks$peaks
}
```

---

getUniqueCleavageEvents

Using UMI sequence to obtain the starting sequence library

Description

PCR amplification often leads to biased representation of the starting sequence population. To track the sequence tags present in the initial sequence library, a unique molecular identifier (UMI) is added to the 5 prime of each sequence in the staring library. This function uses the UMI sequence plus the first few sequence from R1 reads to obtain the starting sequence library.

Usage

```
getUniqueCleavageEvents(alignment.inputfile, umi.inputfile,
 alignment.format = c("auto", "bam", "bed"),
 umi.header = FALSE, read.ID.col = 1,
umi.col = 2, umi.sep = "\t", keep.chrM = FALSE,
keep.R1only = TRUE, keep.R2only = TRUE,
concordant.strand = TRUE, max.paired.distance = 1000,
min.mapping.quality = 30, max.R1.len = 130, max.R2.len = 130,
apply.both.max.len = FALSE, same.chromosome = TRUE,
distance.inter.chrom = -1, min.R1.mapped = 20, min.R2.mapped = 20,
apply.both.min.mapped = FALSE, max.duplicate.distance = 0,
umi.plus.R1start.unique = TRUE, umi.plus.R2start.unique = TRUE,
n.cores.max = 6)
```

Arguments

alignment.inputfile

> The alignment file. Currently supports bed output file with CIGAR information. Suggest run the workflow binReads.sh, which sequentially runs barcode binning, adaptor removal, alignment to genome, alignment quality filtering, and bed file conversion. Please download the workflow function and its helper scripts at http://mccb.umassmed.edu/GUIDE-seq/binReads/

umi.inputfile   A text file containing at least two columns, one is the read identifier and the other is the UMI or UMI plus the first few bases of R1 reads. Suggest use getUMI.sh to generate this file. Please download the script and its helper scripts at http://mccb.umassmed.edu/GUIDE-seq/getUMI/

alignment.format

> The format of the alignment input file. Currently only bam and bed file format is supported. BED format will be deprecated soon.

umi.header   Indicates whether the umi input file contains a header line or not. Default to FALSE

read.ID.col   The index of the column containing the read identifier in the umi input file, default to 1

umi.col   The index of the column containing the umi or umi plus the first few bases of sequence from the R1 reads, default to 2

umi.sep   column separator in the umi input file, default to tab

keep.chrM   Specify whether to include alignment from chrM. Default FALSE

keep.R1only   Specify whether to include alignment with only R1 without paired R2. Default TRUE

keep.R2only   Specify whether to include alignment with only R2 without paired R1. Default TRUE

concordant.strand

      Specify whether the R1 and R2 should be aligned to the same strand or opposite strand. Default opposite.strand (TRUE)

max.paired.distance

      Specify the maximum distance allowed between paired R1 and R2 reads. Default 1000 bp

min.mapping.quality

      Specify min.mapping.quality of acceptable alignments

max.R1.len   The maximum retained R1 length to be considered for downstream analysis, default 130 bp. Please note that default of 130 works well when the read length 150 bp. Please also note that retained R1 length is not necessarily equal to the mapped R1 length

max.R2.len   The maximum retained R2 length to be considered for downstream analysis, default 130 bp. Please note that default of 130 works well when the read length 150 bp. Please also note that retained R2 length is not necessarily equal to the mapped R2 length

apply.both.max.len

      Specify whether to apply maximum length requirement to both R1 and R2 reads, default FALSE

same.chromosome

      Specify whether the paired reads are required to align to the same chromosome, default TRUE

distance.inter.chrom

      Specify the distance value to assign to the paired reads that are aligned to different chromosome, default -1

min.R1.mapped   The maximum mapped R1 length to be considered for downstream analysis, default 30 bp.

min.R2.mapped   The maximum mapped R2 length to be considered for downstream analysis, default 30 bp.

apply.both.min.mapped

      Specify whether to apply minimum mapped length requirement to both R1 and R2 reads, default FALSE

max.duplicate.distance

      Specify the maximum distance apart for two reads to be considered as duplicates, default 0. Currently only 0 is supported

umi.plus.R1start.unique

      To specify whether two mapped reads are considered as unique if both containing the same UMI and same alignment start for R1 read, default TRUE.

umi.plus.R2start.unique

      To specify whether two mapped reads are considered as unique if both containing the same UMI and same alignment start for R2 read, default TRUE.

n.cores.max   Indicating maximum number of cores to use in multi core mode, i.e., parallel processing, default 6. Please set it to 1 to disable multicore processing for small dataset.

Value

cleavage.gr
Cleavage sites with one site per UMI as GRanges with metadata column total
set to 1 for each range

unique.umi.plus.R2
a data frame containing unique cleavage site from R2 reads mapped to plus
strand with the following columns chr.y (chromosome of readSide.y/R2 read)
chr.x (chromosome of readSide.x/R1 read) strand.y (strand of readSide.y/R2
read) strand.x (strand of readSide.x/R1 read) start.y (start of readSide.y/R2 read)
end.x (start of readSide.x/R1 read) UMI (unique molecular identifier (umi) or
umi with the first few bases of R1 read)

unique.umi.minus.R2
a data frame containing unique cleavage site from R2 reads mapped to minus
strand with the following columns chr.y (chromosome of readSide.y/R2 read)
chr.x (chromosome of readSide.x/R1 read) strand.y (strand of readSide.y/R2
read) strand.x (strand of readSide.x/R1 read) end.y (end of readSide.y/R2 read)
start.x (start of readSide.x/R1 read) UMI (unique molecular identifier (umi) or
umi with the first few bases of R1 read)

unique.umi.plus.R1
a data frame containing unique cleavage site from R1 reads mapped to minus
strand without corresponding R2 reads mapped to the plus strand, with the fol-
lowing columns chr.y (chromosome of readSide.y/R2 read) chr.x (chromosome
of readSide.x/R1 read) strand.y (strand of readSide.y/R2 read) strand.x (strand
of readSide.x/R1 read) start.x (start of readSide.x/R1 read) start.y (start of read-
Side.y/R2 read) UMI (unique molecular identifier (umi) or umi with the first few
bases of R1 read)

unique.umi.minus.R1
a data frame containing unique cleavage site from R1 reads mapped to plus
strand without corresponding R2 reads mapped to the minus strand, with the
following columns chr.y (chromosome of readSide.y/R2 read) chr.x (chromo-
some of readSide.x/R1 read) strand.y (strand of readSide.y/R2 read) strand.x
(strand of readSide.x/R1 read) end.x (end of readSide.x/R1 read) end.y (end of
readSide.y/R2 read) UMI (unique molecular identifier (umi) or umi with the first
few bases of R1 read)

all.umi
a data frame containing all the mapped reads with the following columns. read-
Name (read ID), chr.x (chromosome of readSide.x/R1 read), start.x (start of
eadSide.x/R1 read), end.x (end of eadSide.x/R1 read), mapping.qual.x (map-
ping quality of readSide.x/R1 read), strand.x (strand of readSide.x/R1 read),
cigar.x (CIGAR of readSide.x/R1 read) , readSide.x (1/R1), chr.y (chromo-
some of readSide.y/R2 read) start.y (start of readSide.y/R2 read), end.y (end of
readSide.y/R2 read), mapping.qual.y (mapping quality of readSide.y/R2 read),
strand.y (strand of readSide.y/R2 read), cigar.y (CIGAR of readSide.y/R2 read),
readSide.y (2/R2) R1.base.kept (retained R1 length), R2.base.kept (retained R2
length), distance (distance between mapped R1 and R2), UMI (unique molecu-
lar identifier (umi) or umi with the first few bases of R1 read)

```

---

getUsedBarcodes   *Create barcodes from the p5 and p7 index used for each sequencing lane*

Description

Create barcodes from the p5 and p7 index for assigning reads to each barcode

Usage

```
getUsedBarcodes(p5.index, p7.index, header = FALSE, reverse.p7 = TRUE,
    reverse.p5 = FALSE, outputFile)
```

Arguments

`p5.index`	A text file with one p5 index sequence per line
`p7.index`	A text file with one p7 index sequence per line
`header`	Indicate whether there is a header in the p5.index and p7.index files. Default to FALSE
`reverse.p7`	Indicate whether to reverse p7 index, default to TRUE for standard GUIDE-seq experiments
`reverse.p5`	Indicate whether to reverse p5 index, default to FALSE for standard GUIDE-seq experiments
`outputFile`	Give a name to the output file where the generated barcodes are written

Value

DNAStringSet

Note

Create barcode file to be used to bin the reads sequenced in a pooled lane

Author(s)

Lihua Julie Zhu

Examples

```
p7 <- system.file("extdata", "p7.index",
      package = "GUIDEseq")
p5 <- system.file("extdata", "p5.index",
      package = "GUIDEseq")
outputFile <- "usedBarcode"
getUsedBarcodes(p5.index = p5, p7.index = p7, reverse.p7 = TRUE,
    reverse.p5 = FALSE, outputFile = outputFile)
```

GUIDEseqAnalysis   *Analysis pipeline for GUIDE-seq dataset*

Description

A wrapper function that uses the UMI sequence plus the first few bases of each sequence from R1 reads to estimate the starting sequence library, piles up reads with a user defined window and step size, identify the insertion sites (proxy of cleavage sites), merge insertion sites from plus strand and minus strand, followed by off target analysis of extended regions around the identified insertion sites.

Usage

```
GUIDEseqAnalysis(alignment.inputfile, umi.inputfile,
    alignment.format = c("auto", "bam", "bed"),
    umi.header = FALSE, read.ID.col = 1L,
    umi.col = 2L, umi.sep = "\t",

       mismatch.activity.file = system.file("extdata",
           "NatureBiot2016SuppTable19DoenchRoot.csv",
           package = "CRISPRseek"),
       txdb,
       orgAnn
   )
```

Arguments

`alignment.inputfile`

The alignment file. Currently supports bam and bed output file with CIGAR information. Suggest run the workflow binReads.sh, which sequentially runs barcode binning, adaptor removal, alignment to genome, alignment quality filtering, and bed file conversion. Please download the workflow function and its helper scripts at http://mccb.umassmed.edu/GUIDE-seq/binReads/

umi.inputfile   A text file containing at least two columns, one is the read identifier and the other is the UMI or UMI plus the first few bases of R1 reads. Suggest use getUMI.sh to generate this file. Please download the script and its helper scripts at http://mccb.umassmed.edu/GUIDE-seq/getUMI/

alignment.format

The format of the alignment input file. Default bed file format. Currently only bed file format is supported, which is generated from binReads.sh

umi.header   Indicates whether the umi input file contains a header line or not. Default to FALSE

read.ID.col   The index of the column containing the read identifier in the umi input file, default to 1

umi.col   The index of the column containing the umi or umi plus the first few bases of sequence from the R1 reads, default to 2

umi.sep   column separator in the umi input file, default to tab

BSgenomeName   BSgenome object. Please refer to available.genomes in BSgenome package. For example, BSgenome.Hsapiens.UCSC.hg19 for hg19, BSgenome.Mmusculus.UCSC.mm10 for mm10, BSgenome.Celegans.UCSC.ce6 for ce6, BSgenome.Rnorvegicus.UCSC.rn5 for rn5, BSgenome.Drerio.UCSC.danRer7 for Zv9, and BSgenome.Dmelanogaster.UCSC.dm3 for dm3

gRNA.file   gRNA input file path or a DNAStringSet object that contains the target sequence (gRNA plus PAM)

outputDir   the directory where the off target analysis and reports will be written to

n.cores.max   Indicating maximum number of cores to use in multi core mode, i.e., parallel processing, default 1 to disable multicore processing for small dataset.

keep.chrM   Specify whether to include alignment from chrM. Default FALSE

keep.R1only   Specify whether to include alignment with only R1 without paired R2. Default TRUE

keep.R2only   Specify whether to include alignment with only R2 without paired R1. Default TRUE

concordant.strand

Specify whether the R1 and R2 should be aligned to the same strand or opposite strand. Default opposite.strand (TRUE)

max.paired.distance

Specify the maximum distance allowed between paired R1 and R2 reads. Default 1000 bp

min.mapping.quality

Specify min.mapping.quality of acceptable alignments

max.R1.len   The maximum retained R1 length to be considered for downstream analysis, default 130 bp. Please note that default of 130 works well when the read length 150 bp. Please also note that retained R1 length is not necessarily equal to the mapped R1 length

max.R2.len   The maximum retained R2 length to be considered for downstream analysis, default 130 bp. Please note that default of 130 works well when the read length 150 bp. Please also note that retained R2 length is not necessarily equal to the mapped R2 length

apply.both.max.len

Specify whether to apply maximum length requirement to both R1 and R2 reads, default FALSE

same.chromosome
　　　　　Specify whether the paired reads are required to align to the same chromosome, default TRUE

distance.inter.chrom
　　　　　Specify the distance value to assign to the paired reads that are aligned to different chromosome, default -1

min.R1.mapped　The maximum mapped R1 length to be considered for downstream analysis, default 30 bp.

min.R2.mapped　The maximum mapped R2 length to be considered for downstream analysis, default 30 bp.

apply.both.min.mapped
　　　　　Specify whether to apply minimum mapped length requirement to both R1 and R2 reads, default FALSE

max.duplicate.distance
　　　　　Specify the maximum distance apart for two reads to be considered as duplicates, default 0. Currently only 0 is supported

umi.plus.R1start.unique
　　　　　To specify whether two mapped reads are considered as unique if both containing the same UMI and same alignment start for R1 read, default TRUE.

umi.plus.R2start.unique
　　　　　To specify whether two mapped reads are considered as unique if both containing the same UMI and same alignment start for R2 read, default TRUE.

window.size　window size to calculate coverage

step　　　　step size to calculate coverage

bg.window.size　window size to calculate local background

min.reads　minimum number of reads to be considered as a peak

min.reads.per.lib
　　　　　minimum number of reads in each library (usually two libraries) to be considered as a peak

min.peak.score.1strandOnly
　　　　　Specify the minimum number of reads for a one-strand only peak to be included in the output. Applicable when set keepPeaksInBothStrandsOnly to FALSE and there is only one library per sample

min.SNratio　Specify the minimum signal noise ratio to be called as peaks, which is the coverage normalized by local background.

maxP　　　Specify the maximum p-value to be considered as significant

stats　　　Statistical test, currently only poisson is implemented

p.adjust.methods
　　　　　Adjustment method for multiple comparisons, default none

distance.threshold
　　　　　Specify the maximum gap allowed between the plus strand and the negative strand peak, default 40. Suggest set it to twice of window.size used for peak calling.

max.overlap.plusSig.minusSig
　　　　　Specify the cushion distance to allow sequence error and inprecise integration Default to 30 to allow at most 10 (30-window.size 20) bp (half window) of minus-strand peaks on the right side of plus-strand peaks. Only applicable if plus.strand.start.gt.minus.strand.end is set to TRUE.

plus.strand.start.gt.minus.strand.end
              Specify whether plus strand peak start greater than the paired negative strand
              peak end. Default to TRUE

keepPeaksInBothStrandsOnly
              Indicate whether only keep peaks present in both strands as specified by plus.strand.start.gt.minus.stra
              max.overlap.plusSig.minusSig and distance.threshold.

gRNA.format   Format of the gRNA input file. Currently, fasta is supported

PAM.size   PAM length, default 3

gRNA.size   The size of the gRNA, default 20

PAM   PAM sequence after the gRNA, default NGG

overlap.gRNA.positions
              The required overlap positions of gRNA and restriction enzyme cut site, default
              17 and 18 for SpCas9.

max.mismatch   Maximum mismatch to the gRNA (not including mismatch to the PAM) allowed
              in off target search, default 6

PAM.pattern   Regular expression of protospacer-adjacent motif (PAM), default NNN$. Alter-
              natively set it to (NAG|NGG|NGA)$ for off target search

allowed.mismatch.PAM
              Maximum number of mismatches allowed for the PAM sequence plus the num-
              ber of degenerate sequence in the PAM sequence, default to 2 for NGG PAM

upstream   upstream offset from the peak start to search for off targets, default 20 suggest
              set it to window size

downstream   downstream offset from the peak end to search for off targets, default 20 suggest
              set it to window size

overwrite   overwrite the existing files in the output directory or not, default FALSE

weights   a numeric vector size of gRNA length, default c(0, 0, 0.014, 0, 0, 0.395, 0.317,
              0, 0.389, 0.079, 0.445, 0.508, 0.613, 0.851, 0.732, 0.828, 0.615, 0.804, 0.685,
              0.583) for SPcas9 system, which is used in Hsu et al., 2013 cited in the reference
              section. Please make sure that the number of elements in this vector is the same
              as the gRNA.size, e.g., pad 0s at the beginning of the vector.

orderOfftargetsBy
              Criteria to order the offtargets, which works together with the descending pa-
              rameter

descending   Indicate the output order of the offtargets, i.e., in the descending or ascending
              order.

keepTopOfftargetsOnly
              Output all offtargets or the top offtarget using the keepOfftargetsBy criteria,
              default to the top offtarget

keepTopOfftargetsBy
              Output the top offtarget for each called peak using the keepTopOfftargetsBy
              criteria, If set to predicted_cleavage_score, then the offtargets with the highest
              predicted cleavage score will be retained If set to n.mismatch, then the offtarget
              with the lowest number of mismatch to the target sequence will be retained

scoring.method Indicates which method to use for offtarget cleavage rate estimation, currently
              two methods are supported, Hsu-Zhang and CFDscore

subPAM.activity
              Applicable only when scoring.method is set to CFDscore A hash to represent
              the cleavage rate for each alternative sub PAM sequence relative to preferred
              PAM sequence

subPAM.position

Applicable only when scoring.method is set to CFDscore The start and end positions of the sub PAM. Default to 22 and 23 for SP with 20bp gRNA and NGG as preferred PAM

PAM.location   PAM location relative to gRNA. For example, default to 3prime for spCas9 PAM. Please set to 5prime for cpf1 PAM since it's PAM is located on the 5 prime end

mismatch.activity.file

Applicable only when scoring.method is set to CFDscore A comma separated (csv) file containing the cleavage rates for all possible types of single nucleotide mismatche at each position of the gRNA. By default, using the supplemental Table 19 from Doench et al., Nature Biotechnology 2016

txdb   TxDb object, for creating and using TxDb object, please refer to GenomicFeatures package. For a list of existing TxDb object, please search for annotation package starting with Txdb at http://www.bioconductor.org/packages/release/BiocViews.html#___An such as TxDb.Rnorvegicus.UCSC.rn5.refGene for rat, TxDb.Mmusculus.UCSC.mm10.knownGene for mouse, TxDb.Hsapiens.UCSC.hg19.knownGene for human, TxDb.Dmelanogaster.UCSC.dm3.en for Drosophila and TxDb.Celegans.UCSC.ce6.ensGene for C.elegans

orgAnn   organism annotation mapping such as org.Hs.egSYMBOL in org.Hs.eg.db package for human

Value

offTargets   a data frame, containing all input peaks with potential gRNA binding sites, mismatch number and positions, alignment to the input gRNA and predicted cleavage score.

merged.peaks   merged peaks as GRanges with count (peak height), bg (local background), SNratio (signal noise ratio), p-value, and option adjusted p-value

peaks   GRanges with count (peak height), bg (local background), SNratio (signal noise ratio), p-value, and option adjusted p-value

uniqueCleavages

Cleavage sites with one site per UMI as GRanges with metadata column total set to 1 for each range

read.summary   One table per input mapping file that contains the number of reads for each chromosome location

```

mergePlusMinusPeaks   *Merge peaks from plus strand and minus strand*

Description

Merge peaks from plus strand and minus strand with required orientation and within certain distance apart

Usage

```
mergePlusMinusPeaks(peaks.gr, peak.height.mcol = "count",
    bg.height.mcol = "bg", distance.threshold = 40L,
    max.overlap.plusSig.minusSig = 30L,
    plus.strand.start.gt.minus.strand.end = TRUE, output.bedfile)
```

Arguments

peaks.gr   Specify the peaks as GRanges object, which should contain peaks from both plus
                    and minus strand. In addition, it should contain peak height metadata column to
                    store peak height and optionally background height.

peak.height.mcol
                    Specify the metadata column containing the peak height, default to count

bg.height.mcol   Specify the metadata column containing the background height, default to bg

distance.threshold
                    Specify the maximum gap allowed between the plus stranded and the negative
                    stranded peak, default 40. Suggest set it to twice of window.size used for peak
                    calling.

max.overlap.plusSig.minusSig
                    Specify the cushion distance to allow sequence error and inprecise integration
                    Default to 30 to allow at most 10 (30-window.size 20) bp (half window) of
                    minus-strand peaks on the right side of plus-strand peaks. Only applicable if
                    plus.strand.start.gt.minus.strand.end is set to TRUE.

plus.strand.start.gt.minus.strand.end
Specify whether plus strand peak start greater than the paired negative strand peak end. Default to TRUE

output.bedfile   Specify the bed output file name, which is used for off target analysis subsequently.

Value

output a list and a bed file containing the merged peaks a data frame of the bed format

mergedPeaks.gr   merged peaks as GRanges

mergedPeaks.bed
merged peaks in bed format

offTargetAnalysisOfPeakRegions
Offtarget Analysis of GUIDE-seq peaks

Description

Finding offtargets around peaks from GUIDE-seq or around any given genomic regions

Usage

```
offTargetAnalysisOfPeakRegions(gRNA, peaks,
    format=c("fasta", "bed"),
    peaks.withHeader = FALSE, BSgenomeName, overlap.gRNA.positions = c(17,18),
    upstream = 20L, downstream = 20L, PAM.size = 3L, gRNA.size = 20L,
    PAM = "NGG", PAM.pattern = "NNN$", max.mismatch = 6L,
```

```
outputDir, allowed.mismatch.PAM = 2L, overwrite = TRUE,
weights = c(0, 0, 0.014, 0, 0, 0.395,
0.317, 0, 0.389, 0.079, 0.445, 0.508, 0.613, 0.851, 0.732, 0.828, 0.615,
0.804, 0.685, 0.583),
orderOfftargetsBy = c("predicted_cleavage_score", "n.mismatch"),
descending = TRUE,
keepTopOfftargetsOnly = TRUE,
scoring.method = c("Hsu-Zhang", "CFDscore"),
    subPAM.activity = hash( AA =0,
      AC =   0,
      AG = 0.259259259,
      AT = 0,
      CA = 0,
      CC = 0,

      TC = 0,
      TG = 0.038961039,
      TT = 0),
 subPAM.position = c(22, 23),
 PAM.location = "3prime",
 mismatch.activity.file = system.file("extdata",
     "NatureBiot2016SuppTable19DoenchRoot.csv",
     package = "CRISPRseek"),
 n.cores.max = 1
 )
```

Arguments

gRNA	gRNA input file path or a DNAStringSet object that contains gRNA plus PAM sequences used for genome editing
peaks	peak input file path or a GenomicRanges object that contains genomic regions to be searched for potential offtargets
format	Format of the gRNA and peak input file. Currently, fasta and bed are supported for gRNA and peak input file respectively
peaks.withHeader	
	Indicate whether the peak input file contains header, default FALSE
PAM.size	PAM length, default 3
gRNA.size	The size of the gRNA, default 20
PAM	PAM sequence after the gRNA, default NGG
BSgenomeName	BSgenome object. Please refer to available.genomes in BSgenome package. For example, BSgenome.Hsapiens.UCSC.hg19 for hg19, BSgenome.Mmusculus.UCSC.mm10 for mm10, BSgenome.Celegans.UCSC.ce6 for ce6, BSgenome.Rnorvegicus.UCSC.rn5 for rn5, BSgenome.Drerio.UCSC.danRer7 for Zv9, and BSgenome.Dmelanogaster.UCSC.dm3 for dm3

overlap.gRNA.positions

The required overlap positions of gRNA and restriction enzyme cut site, default 17 and 18 for SpCas9.

max.mismatch   Maximum mismatch allowed in off target search, default 6

PAM.pattern   Regular expression of protospacer-adjacent motif (PAM), default to any NNN$. Set it to (NAG|NGG|NGA)$ if only outputs offtargets with NAG, NGA or NGG PAM

allowed.mismatch.PAM

Number of degenerative bases in the PAM.pattern sequence, default to 2

outputDir   the directory where the off target analysis and reports will be written to

upstream   upstream offset from the peak start to search for off targets, default 20

downstream   downstream offset from the peak end to search for off targets, default 20

overwrite   overwrite the existing files in the output directory or not, default FALSE

weights   a numeric vector size of gRNA length, default c(0, 0, 0.014, 0, 0, 0.395, 0.317, 0, 0.389, 0.079, 0.445, 0.508, 0.613, 0.851, 0.732, 0.828, 0.615, 0.804, 0.685, 0.583) for SPcas9 system, which is used in Hsu et al., 2013 cited in the reference section. Please make sure that the number of elements in this vector is the same as the gRNA.size, e.g., pad 0s at the beginning of the vector.

orderOfftargetsBy

criteria to order the offtargets by and the top one will be kept if keepTopOfftargetsOnly is set to TRUE. If set to predicted_cleavage_score (descending order), the offtarget with the highest predicted cleavage score for each peak will be kept. If set to n.mismatch (ascending order), the offtarget with the smallest number of mismatch to the target sequence for each peak will be kept.

descending   No longer used. In the descending or ascending order. Default to order by predicted cleavage score in descending order and number of mismatch in ascending order When altering orderOfftargetsBy order, please also modify descending accordingly

keepTopOfftargetsOnly

Output all offtargets or the top offtarget per peak using the orderOfftargetsBy criteria, default to the top offtarget

scoring.method Indicates which method to use for offtarget cleavage rate estimation, currently two methods are supported, Hsu-Zhang and CFDscore

subPAM.activity

Applicable only when scoring.method is set to CFDscore A hash to represent the cleavage rate for each alternative sub PAM sequence relative to preferred PAM sequence

subPAM.position

Applicable only when scoring.method is set to CFDscore The start and end positions of the sub PAM. Default to 22 and 23 for SP with 20bp gRNA and NGG as preferred PAM

PAM.location   PAM location relative to gRNA. For example, default to 3prime for spCas9 PAM. Please set to 5prime for cpf1 PAM since it's PAM is located on the 5 prime end

mismatch.activity.file

Applicable only when scoring.method is set to CFDscore A comma separated (csv) file containing the cleavage rates for all possible types of single nucleotide mismatche at each position of the gRNA. By default, using the supplemental Table 19 from Doench et al., Nature Biotechnology 2016

n.cores.max   Indicating maximum number of cores to use in multi core mode, i.e., parallel
                   processing, default 1 to disable multicore processing for small dataset.

Value

a tab-delimited file offTargetsInPeakRegions.tsv, containing all input peaks with potential gRNA
binding sites, mismatch number and positions, alignment to the input gRNA and predicted cleavage
score.

uniqueCleavageEvents   *example unique cleavage sites*

Description

An example data set containing cleavage sites with unique UMI, generated from getUniqueCleavageEvents

Usage

```
data("uniqueCleavageEvents")
```

Value

> **cleavage.gr** Cleavage sites with one site per UMI as GRanges with metadata column total set to 1 for each range
>
> **unique.umi.plus.R2** a data frame containing unique cleavage site from R2 reads mapped to plus strand with the following columns chr.y (chromosome of readSide.y/R2 read) chr.x (chromosome of readSide.x/R1 read) strand.y (strand of readSide.y/R2 read) strand.x (strand of readSide.x/R1 read) start.y (start of readSide.y/R2 read) end.x (start of readSide.x/R1 read) UMI (unique molecular identifier (umi) or umi with the first few bases of R1 read)
>
> **unique.umi.minus.R2** a data frame containing unique cleavage site from R2 reads mapped to minus strand with the following columns chr.y (chromosome of readSide.y/R2 read) chr.x (chromosome of readSide.x/R1 read) strand.y (strand of readSide.y/R2 read) strand.x (strand of readSide.x/R1 read) end.y (end of readSide.y/R2 read) start.x (start of readSide.x/R1 read) UMI (unique molecular identifier (umi) or umi with the first few bases of R1 read)
>
> **unique.umi.plus.R1** a data frame containing unique cleavage site from R1 reads mapped to minus strand without corresponding R2 reads mapped to the plus strand, with the following columns chr.y (chromosome of readSide.y/R2 read) chr.x (chromosome of readSide.x/R1 read) strand.y (strand of readSide.y/R2 read) strand.x (strand of readSide.x/R1 read) start.x (start of readSide.x/R1 read) start.y (start of readSide.y/R2 read) UMI (unique molecular identifier (umi) or umi with the first few bases of R1 read)
>
> **unique.umi.minus.R1** a data frame containing unique cleavage site from R1 reads mapped to plus strand without corresponding R2 reads mapped to the minus strand, with the following columns chr.y (chromosome of readSide.y/R2 read) chr.x (chromosome of readSide.x/R1 read) strand.y (strand of readSide.y/R2 read) strand.x (strand of readSide.x/R1 read) end.x (end of readSide.x/R1 read) end.y (end of readSide.y/R2 read) UMI (unique molecular identifier (umi) or umi with the first few bases of R1 read)
>
> **all.umi** a data frame containing all the mapped reads with the following columns. readName (read ID), chr.x (chromosome of readSide.x/R1 read), start.x (start of eadSide.x/R1 read), end.x (end of eadSide.x/R1 read), mapping.qual.x (mapping quality of readSide.x/R1 read), strand.x (strand of readSide.x/R1 read), cigar.x (CIGAR of readSide.x/R1 read) , readSide.x (1/R1), chr.y (chromosome of readSide.y/R2 read) start.y (start of readSide.y/R2 read), end.y (end of readSide.y/R2 read), mapping.qual.y (mapping quality of readSide.y/R2 read), strand.y (strand of readSide.y/R2 read), cigar.y (CIGAR of readSide.y/R2 read), readSide.y (2/R2) R1.base.kept (retained R1 length), R2.base.kept (retained R2 length), distance (distance between mapped R1 and R2), UMI (unique molecular identifier (umi) or umi with the first few bases of R1 read)
