

Package ‘GSBenchMark’

October 23, 2025

Version 1.29.0

Date 2014

Title Gene Set Benchmark

Author Bahman Afsari <bahman@jhu.edu>, Elana J. Fertig
<ejfertig@jhmi.edu>

Maintainer Bahman Afsari <bahman@jhu.edu>

Depends R (>= 2.13.1)

Description Benchmarks for Machine Learning Analysis of the Gene Sets.
The package contains a list of pathways and gene expression
data sets used in ``Identifying Tightly Regulated and Variably
Expressed Networks by Differential Rank Conservation (DIRAC)"
(2010) by Eddy et al.

--------------	-----------

GSBenchMark-package	<i>A list of pathways and 11 datasets consisting gene expressions and phenotypes as the benchmark for Gene Set Analysis. Most of this information was used to validate Differential Rank Conservation (DIRAC) in the first place. In addition the data in the Eddy et al. (2010) paper, we also provide two datasets.</i>
---------------------	---

Description

The GSBenchMark package contains data for testing gene set analysis with two phenotypes. Specially, the user can use the datasets used for validating Differential Rank Conservation (DIRAC) (Eddy et al. 2010). This datasets are used in the package GSReg which implements DIRAC and a more efficient alternative called GSVReg.

GSBenchMark package features

The dataset are included:

leukemia_GSEA marfan_GDS2960 melanoma_GDS2735 parkinsons_GDS2519 prostate_GDS2545_m_nf prostate_GDS2545_m_p prostate_GDS2545_p_nf sarcoma_data squamous_GDS2520 breast_GDS807 bipolar_GDS2190 The phenotypes has also been provided and the pathways. For more details, please see the individual help of each dataset as well as (Eddy et al. 2010).

bipolar_GDS2190	<i>Gene expression matrix and a factor for binary phenotypes from DIRAC paper: Bipolar</i>
-----------------	--

Description

Bipolar dataset: Gene expression matrix and a factor with binary ("Normal", "Bipolar") phenotypes corresponding to the samples.

Usage

```
data(bipolar_GDS2190)
```

Format

The bipolar_GDS2190 exprsdata contains normalized expression values (rows) across samples (columns). Group information is in the factor phenotypes.

Details

This dataset corresponds to Bipolar disorder (Bipolar or Normal) in Eddy and colleagues in PLoS Comp. Bio. (2010) and originally from Ryan et al. (2006)

breast_GDS807	<i>Gene expression matrix and a factor for binary phenotypes from DIRAC paper: Breast cancer</i>
---------------	--

Description

Squamous dataset: Gene expression matrix and a factor with binary ("Responsive", "non-Responsive") phenotypes corresponding to the samples.

Usage

```
data(breast_GDS807)
```

Format

The breast_GDS807 exprsdata contains normalized expression values (rows) across samples (columns). Group information is in the factor phenotypes.

Details

This dataset corresponds to the breast cancer data set in Eddy and colleagues in PLoS Comp. Bio. (2010) and originally from Ma et al. (2004)

diracpathways

The pathways downloaded from DIRAC paper

Description

A list of gene sets representing pathways in Eddy et al (2010).

Usage

```
data(diracpathways)
```

Format

The diracpathways list contains the list of pathways. Each element is a vector of gene names.

Details

This list has been extracted from Eddy et al (2010).

 exprsdata

Gene expression matrix from DIRAC paper

Description

Gene expression matrices from different datasets will have this name. When the user loads a dataset from GSBenchMark, one of the variables loaded has this name.

Usage

```
exprsdata
```

Format

The exprsdata contains normalized of any dataset loaded from GSBenchMark package. The rows represent genes and the columns samples.

Details

This dataset corresponds to the Prostate cancer in Eddy and colleagues in PLoS Comp. Bio. (2010).

GSBenchMarkDatasets	<i>The names of the datasets of gene expressions and phenotypes downloaded from DIRAC paper</i>
---------------------	---

Description

The list of datasets used in Eddy et al (2010).

Usage

```
data(GSBenchMarkDatasets)
```

Format

The GSBenchMark.Dataset.names list contains the names of the datasets with gene expressions and phenotypes.

Details

This list gene expression datasets provided in Eddy et al (2010).

```

leukemia_GSEA	<i>Gene expression matrix and a factor for binary phenotypes from DIRAC paper: Leukaemia</i>
---------------	--

Description

Leukaemia dataset: Gene expression matrix and a factor with binary (AML, ALL) phenotypes corresponding to the samples.

Usage

```
data(leukemia_GSEA)
```

Format

The leukemia_GSEA exprsdata contains normalized expression values (rows) across samples (columns). Group information is in the factor phenotypes.

Details

This dataset corresponds to the Leukemia in Eddy and colleagues in PLoS Comp. Bio. (2010) and originally Armstrong and et al (2002).

```

logexprsdata*Gene expression matrix from DIRAC paper*

Description

The log of gene expressions are saved in matrices with this name. When the user loads a dataset from GSBenchMark, one of the variables loaded has this name.

Usage

```
logexprsdata
```

Format

The logexprsdata contains the log of normalized of any dataset loaded from GSBenchMark package. The rows represent genes and the columns samples.

Details

This dataset corresponds to the Prostate cancer in Eddy and colleagues in PLoS Comp. Bio. (2010).

head(rownames(logexprsdata), n=10)
```

marfan_GDS2960

*Gene expression matrix and a factor for binary phenotypes from
DIRAC paper: Marfan*

Description

Marfan dataset: Gene expression matrix and a factor with binary ("non-MFS", "MFS") phenotypes corresponding to the samples.

Usage

```
data(marfan_GDS2960)
```

Format

The marfan_GDS2960 exprsdata contains normalized expression values (rows) across samples (columns). Group information is in the factor phenotypes.

Details

This dataset corresponds to Marfan disease in Eddy and colleagues in PLoS Comp. Bio. (2010) and originally Yao (2007).

```

melanoma_GDS2735	<i>Gene expression matrix and a factor for binary phenotypes from DIRAC paper: Melanoma</i>
------------------	---

Description

Melanoma dataset: Gene expression matrix and a factor with binary phenotypes ("Normal", "Metastasis") corresponding to the samples.

Usage

```
data(melanoma_GDS2735)
```

Format

The melanoma_GDS2735 exprsdata contains normalized expression values (rows) across samples (columns). Group information is in the factor phenotypes.

Details

This dataset corresponds to the melanoma cancer in Eddy and colleagues in PLoS Comp. Bio. (2010) and originally from Critchley-Thorne (2007).

parkinsons_GDS2519	<i>Gene expression matrix and a factor for binary phenotypes from DIRAC paper: Parkinson's</i>
--------------------	--

Description

Parkinson's dataset: Gene expression matrix and a factor with binary ("Normal", "Parkinson's") phenotypes corresponding to the samples.

Usage

```
data(parkinsons_GDS2519)
```

Format

The parkinsons_GDS2519 exprsdata contains normalized expression values (rows) across samples (columns). Group information is in the factor phenotypes.

Details

This dataset corresponds to the Parkinson's disease in Eddy and colleagues in PLoS Comp. Bio. (2010) and originally Scherzer (2007).

```

phenotypes*A factor for binary phenotypes from DIRAC paper*

Description

a factor for binary phenotypes corresponding to the samples and a two-element vector with the real label names. When the user loads one of data set from the GSBenchMark it will contain these two variables.

Usage

```
phenotypes  
phenotypesLevels
```

Format

The phenotypes is a binary ("0" or "1") factor containing the phenotypes of the the samples in any dataset loaded from GSBenchMark package. "0" corresponds to less dangerous phenotype and "1" to more dangerous phenotype. The phenotypesLevels contains the real labels instead of "0" and "1".

Details

This dataset corresponds to the Prostate cancer in Eddy and colleagues in PLoS Comp. Bio. (2010).

prostate_GDS2545_m_nf *Gene expression matrix and a factor for binary phenotypes from DIRAC paper: Prostate*

Description

Prostate dataset: Gene expression matrix and a factor with binary phenotypes ("Normal" and "Metastasis") corresponding to the samples.

Usage

```
data(prostate_GDS2545_m_nf)
```

Format

The prostate_GDS2545_m_nf exprsdata contains normalized expression values (rows) across samples (columns). Group information is in the factor phenotypes.

Details

This dataset corresponds to the Prostate cancer in Eddy and colleagues in PLoS Comp. Bio. (2010).

prostate_GDS2545_m_p	<i>Gene expression matrix and a factor for binary phenotypes from DIRAC paper: Prostate</i>
----------------------	---

Description

Prostate dataset: Gene expression matrix and a factor with binary phenotypes ("Primary" and "Metastasis") corresponding to the samples.

Usage

```
data(prostate_GDS2545_m_p)
```

Format

The prostate_GDS2545_m_p exprsdata contains normalized expression values (rows) across samples (columns). Group information is in the factor phenotypes.

Details

This dataset corresponds to the Prostate cancer in Eddy and colleagues in PLoS Comp. Bio. (2010) and originally from Chandran (2007).

squamous_GDS2520	<i>Gene expression matrix and a factor for binary phenotypes from DIRAC paper: Squamous (Head and Neck Cancer)</i>
------------------	--

Description

Squamous dataset: Gene expression matrix and a factor with binary phenotypes (Normal, HNSCC) corresponding to the samples.

Usage

```
data(squamous_GDS2520)
```

Format

The squamous_GDS2520 exprsdata contains normalized expression values (rows) across samples (columns). Group information is in the factor phenotypes.

Details

This dataset corresponds to the Squamous (Head and Neck) cancer in Eddy and colleagues in PLoS Comp. Bio. (2010) and originally from Kuriakose et al.
